ENVIRONMENTAL ASSESSMENT BOARD
ONTARIO HYDRO DEMAND/SUPPLY PLAN HEARING

IN THE MATTER OF the Environmental Assessment Act,
R.S.O. 1980, c. 140, as amended, and Regulations
thereunder;

AND IN THE MATTER OF an undertaking by Ontario Hydro
consisting of a program in respect of activities
associated with meeting future electricity
requirements in Ontario.

Held on the 5th Floor, 2200
Yonge Street, Toronto, Ontario,
on Monday, the 27th day of May,
1991, commencing at 10:00 a.m.

1 ---Upon commencing at 10:02 a.m.

2 THE REGISTRAR: Please come to order.
3 This hearing is now in session. Please be seated.

4 MRS. FORMUSA: With Mr. Watson's
5 indulgence again.

6 We have been discussing the matter of
7 transcript undertakings and a way to facilitate the
8 organization of those undertakings for this panel and
9 future panels. We have a suggestion to make that,
10 perhaps, when witnesses are giving an undertaking, or
11 counsel, that we mention on the transcript the exhibit
12 number that's been assigned, Exhibit 142, and that way,
13 if anyone is doing a computer search, to do a check to
14 make sure we haven't missed one, we can always tickle
15 it with 142.

16 So, if we are all fairly diligent in
17 saying 142, it will appear on the transcript and there
18 will be no doubt that it is an actual transcript
19 undertaking.

20 When we then come back to file the
21 answers to those undertakings, we will just assign the
22 suffix of .1 and .2, and that will be noted next to the
23 page in the exhibit file.

24 THE CHAIRMAN: But there will be no
25 reference to the suffix in the transcript itself?

1 MRS. FORMUSA: We could do that as well.
2 I counted up over the weekend a number of undertakings
3 and I have a rough idea. We could start doing that.

4 THE CHAIRMAN: What is your rough idea?

5 MRS. FORMUSA: About 35.

6 THE CHAIRMAN: For Panel 2?

7 MRS. FORMUSA: Yes.

8 THE CHAIRMAN: So, we start at 40 now.

9 MRS. FORMUSA: I think I even allowed
10 some grace in the 35 as well. So, I thought if we
11 started at 35 or 36, we could also do it by suffix.

12 THE CHAIRMAN: That might be easier for
13 searching purposes.

14 MRS. FORMUSA: It would certainly be one
15 level of assistance for everyone.

16 THE CHAIRMAN: We will try it and see how
17 it works.

18 MRS. FORMUSA: Do you wish to start at
19 142.36?

20 THE CHAIRMAN: All right.

21 MR. WATSON: Mr. Chairman, Members of the
22 Committee, I am turning to a new area. As you note,
23 for the last while we were dealing with reserve margin.

24 With me today I have Mr. Robert Koppe,
25 who is a specialist in power plant.

1 THE CHAIRMAN: There is a problem with
2 the microphones.

3 MR. WATSON: As I was saying, Mr.
4 Chairman, today I am turning away from reserve margin
5 issues. I have had with me Mr. Robert Koppe, who
6 specializes in power plant reliability and design, as
7 as well as nuclear safety.

8 The first area that I will be dealing
9 with is plant life extension issues. I would like to
10 start by introducing the next exhibit, which Mr.
11 Lucas -- and it is a series of excerpts from various
12 documents provided by Hydro.

13 THE REGISTRAR: That will be No. 144, Mr.
14 Chairman.

15 THE CHAIRMAN: 144. Thank you.
16 ---EXHIBIT NO. 144: Document excerpts.

17 MR. WATSON: There are copies up here for
18 the intervenors. You will notice there are three sets
19 dealing with not only the life extension issues, but it
20 looks as though you can also get the environmental
21 issues and the plant performance issues as well. I
22 will be introducing those as exhibits later.

23 RONALD TABOREK,
24 DAVID BARRIE,
JOHN KENNETH SNELSON,
25 JUDITH RYAN; Resumed

1 CROSS-EXAMINATION BY MR. WATSON (Cont'd):

2 Q. Panel, before we get into the
3 exhibit, I would like to deal with a little bit of
4 background, if I could.

5 First of all, some basic definitions, if
6 we could try and get some terminology consistent in
7 dealing with this whole area of life extension.

8 First of all, plant aging, would a fair
9 definition be: Physical deterioration of equipment
10 which occurs with increasing usage and is beyond
11 matters dealt with by routine maintenance?

12 MR. TABOREK: A. It can also, if use is
13 also defined to include the period in which the plant
14 is not actually operating but is deteriorating due to
15 time alone.

16 Q. Second of all, plant obsolescence,
17 the process of a plant losing its economic usefulness,
18 it usually involves some combination of increased
19 expenses due to aging, increased fuel costs, cheaper
20 alternatives, changes in externalities, such as
21 environmental regulations?

22 A. In my mind, I would exclude the
23 first.

24 Q. That's the increased expenses due to
25 aging?

1 [10:10 a.m.] Q. And last, plant life extension,
2 continued operation of a plant beyond the nominal
3 design or planning life?

4 A. I would delete the word "design" life
5 beyond the nominal planning life.

6 Q. In dealing with the DSP, I understand
7 that the plant lifetime that has been assumed is a
8 40-year plant life for all nuclear and fossil steam
9 units; is that correct?

10 A. Yes.

11 Q. Okay. Now, dealing with the
12 background of some of these plants in general, I take
13 it, it is fair to say that the Lambton and Lakeview
14 plants are roughly 20 to 30 years old and are the
15 oldest of the large operating fossil plants?

16 A. Yes. Lakeview is the oldest and
17 Lambton is next.

18 Q. And over the past several years, they
19 have shown considerable aging and Hydro is in the
20 process of rehabilitating them, and that rehabilitation
21 program is expected to improve their performance?

22 A. Yes.

23 Q. And is it fair to say that these
24 units are not today obsolete, which means that in
25 Hydro's estimation, the rehabilitation program now is

1 economical?

2 A. Yes, with some reservations about
3 Lakeview.

4 Q. Well, perhaps we could deal with
5 that. In dealing with the reservations about Lakeview
6 and the whole economics of obsolescence, if you will,
7 is it fair to say that, just generally, before we get
8 into that, if you need a unit with the characteristics
9 of an existing unit, then you have a very simple
10 decision; you either keep what you have or you bring in
11 a new one.

12 And if the existing unit --

13 A. You mean exactly like the old one?

14 Q. Well, I imagine, in the real world,
15 you are not going to bring in one exactly like the old
16 one. You are going to look at the trade-offs that are
17 going to be available with, I imagine, issues such as
18 new technology, would you not?

19 A. Yes. If you use a new one in the
20 broadest sense of a new alternative--

21 Q. Yes.

22 A. --then, yes.

23 Q. And then in making that decision, you
24 decide if the existing unit is more expensive than the
25 new unit; then, it, in effect, is obsolete and if not,

1 then you do the necessary rehabilitation and you keep
2 the old plant?

3 A. Yes.

4 Q. And as you were mentioning about
5 Lakeview, I imagine a number of factors you would look
6 at would be things such as the start-up of Darlington,
7 the economic realities that we are experiencing lately,
8 acid gas limits, the fact that Lakeview is not getting
9 scrubbers; all of those issues would be lumped together
10 to determine, in fact, whether Lakeview would or would
11 not be in the mix; is that fair?

12 A. Yes.

13 Q. Okay. Now, looking at this in a
14 little more detail, is it fair to say that the
15 economics would primarily involve these four main
16 issues: Environmental issues; capital; OM&A, and that
17 would be operating, maintenance and administration
18 expenses; and fuel?

19 Are those the four main areas you would
20 look at in making that sort of decision?

21 A. Yes. They are certainly factors and
22 I am just reluctant to give a blanket exclusion of
23 everything else, though.

24 Q. Well, no. I wasn't trying to --

25 A. Yes. But those are certainly four

1 prime factors, important factors, in the decision, yes.

2 Q. Okay. Is there one that I have
3 omitted that would be more important than any of these?

4 A. Well, fuel supply, for instance,
5 comes to -- oh, you have fuel. I'm sorry.

6 Q. Okay. I thought I --

7 A. Yes. You did include fuel.

8 The availability of alternatives, and if
9 you are applying those same factors, but it is seldom
10 that four factors alone influence everything about a
11 decision.

12 Q. It is fair to say that those are four
13 main factors?

14 A. Yes.

15 Q. Now, dealing first with the
16 environmental factor, if we could, is it fair to say
17 that if we put the same or similar emission control
18 equipment on an existing unit as would be on a new
19 unit, then the units are environmentally very similar
20 with respect to the emissions?

21 A. Not, not necessarily. There may be,
22 say, space considerations that would prevent putting
23 the same control device on an old unit as a new unit.
24 There may be problems with the delivery of raw
25 materials and the extraction of wastes. There may be

1 factors in the operation of the old unit that do not
2 permit a perfect mating, the same degree of mating that
3 you can get with a new unit.

4 Q. And I suppose it is also fair to say
5 that in a new plant, you would have environmental
6 concerns, such as new site might be required, there
7 might be new transmission required, there might be more
8 construction dust; things like that.

9 Is it fair to say in looking at this as
10 just a first order approximation, if you will, that the
11 new units and the old units, taking into account some
12 of the factors you mentioned, would be environmentally
13 similar with respect to their emissions?

14 A. I think that is a long jump to make.
15 I do not think I would agree to that--

16 Q. Okay.

17 A. --for the reasons I have outlined.
18 In many instances they can be, but I don't think you
19 can give a blanket assurance.

20 Q. One of the factors you mentioned was
21 lack of space. You were probably referring to
22 Lakeview, were you?

23 A. Yes.

24 Q. I have come across that in the
25 literature. I haven't come across that for any of the

1 other plants. Is it fair to say Lakeview is the only
2 plant where that is an issue today?

3 A. Yes.

4 Q. So, in another plant - say, Lambton,
5 for instance - if that issue didn't occur, and if you
6 were able to get sufficient supplies to Lambton, then
7 based on what you have said, you would probably have a
8 situation where there would be similar emissions from a
9 plant, such as Lambton, which had backfitted
10 environmental controls on it, as opposed to a new unit?

11 A. Now. You are using environmental
12 controls in their broadest sense there--

13 Q. Yes.

14 A. --I am answering you to this point
15 primarily with respect to scrubbers, because you have a
16 host of environmental controls which depend on the
17 future regulations that you will be forced to meet, and
18 so one of the next set of controls that is possible is
19 selective catalytic reduction.

20 And then going beyond that, environmental
21 regulations in the past have been tightened - our coal
22 plants - approximately every two years, and there
23 remains a heightened environmental sensitivity, so I am
24 very reluctant to -- and what I mean by that is, I
25 expect further changes in the future. I don't exactly

1 know what they will be.

2 Having said that, I am not in a position,
3 then, to say that, in future, there will be space for
4 whatever new environmental devices are required on our
5 plants over the next 20 years.

6 MR. SNELSON: A. I think it's fair to
7 say that as a principle, that it is more difficult to
8 add facilities to an existing design than it is to
9 incorporate them into the design from the initial
10 stages of the design. That, I think, is the principle
11 that makes it more difficult to add things to the old
12 plant than to incorporate them into the new.

13 Q. Have you investigated adding SCRs to
14 Lambton or Nanticoke?

15 MR. TABOREK: A. No, not in detail.

16 Q. Okay. Just turn to the Exhibit 144.
17 You will see that what is labelled page 3 is the Hydro
18 response to Interrogatory 2.14.11, and on the second
19 page of that, is the actual answer.

20 What I would like to deal with is the
21 cost of adding scrubbers and as you see in following
22 down under the heading "Response," No.(a), the cost in
23 current 1989 dollars of scrubbers at Lambton is 181.3
24 dollars per kilowatt.

25 A. Yes. ...

1 [10:22 a.m.] Q. Could I ask you whether that includes
2 any allowance for funds during construction? I wasn't
3 able to find anything on that and I made the assumption
4 that it did not. But can you help me as to whether it
5 does?

6 A. No, I can't.

7 Q. Mr. Taborek, if you could just get
8 back to me on whether that does or not, I would
9 appreciate that. And pursuant to what Mrs. Formusa --

10 THE CHAIRMAN: The cost of what? I'm
11 sorry, I didn't quite get that.

12 MR. WATSON: The cost of funds during
13 construction, the cost of money, in effect.

14 THE CHAIRMAN: The cost of borrowing
15 money?

16 MR. WATSON: Yes.

17 THE CHAIRMAN: The cost of money.

18 MR. WATSON: The cost of money, indeed.

19 And as Mrs. Formusa was saying earlier, I
20 assume that would be No. 142.36.

21 Q. If we continue on with that same
22 exhibit. On page 5, Mr. Taborek, that is an excerpt
23 from the Thermal Cost Review. And as you look in the
24 first column, under part 4 "Improved Estimates, Current
25 Conditions," figure 2.6.1.4, under the heading

1 "Existing Site, SPC Dollars per Kilowatt," and you
2 follow down to median estimate, the figure is 259.2.
3 Do you have that?

4 MR. TABOREK: A. Yes.

5 Q. My understanding is that does not
6 include a cost of money, that figure?

7 A. It does not appear to.

8 Q. And in comparing these figures, it
9 seems as though the cost of scrubbers at Lambton would
10 be less than the capital cost of scrubbers for a new 4
11 by 500 megawatt plant, which is what Lambton is; is
12 that fair?

13 A. Yes. The comparison is between 275
14 for the new site and 259 for the old site.

15 Q. Yes.

16 A. Existing site, pardon me.

17 Q. Versus the 181 for Lambton?

18 A. Yes, as recorded in that
19 interrogatory.

20 Q. Yes, thank you.

21 Could you just turn briefly to the issue
22 of SCR. Would the same cost relationship exist with
23 respect to SCR as seems to exist here with respect to
24 scrubbers on old versus new plants?

25 A. I don't think you can say that. I

1 think you would actually have to look at it and make
2 estimates and then reply.

3 Q. Is that because, in fairness to you,
4 Hydro really hasn't had much experience with SCRs?

5 A. Correct. And we have not prepared
6 the same kind of estimates or gone through the same
7 process with SCRs as we have gone through with
8 scrubbers.

9 Q. Could you help us out as to why
10 Lambton would be cheaper; why it seems to be roughly
11 \$80 per kilowatt cheaper?

12 A. In this instance, I think you would
13 have to address the questions of the breakout of the
14 two columns in the rationale to a further panel, the
15 panel dealing with fossil.

16 Q. That would be Panel 8?

17 A. Yes.

18 Q. We'll take that up with them, thank
19 you.

20 If we could turn now to the second factor
21 that we are -- or another factor we are talking about,
22 the OM&A costs. If you turn to the next page in
23 Exhibit 144, that is page 7, which is the answer to
24 Interrogatory 2.9.10, dealing with the OM&A costs for
25 the existing units in the planning period.

1 Under fossil, you will see that Lambton
2 has a value of \$34.4-million in 1989 dollars, and
3 Lambton is a 4 by 500 plant. Nanticoke has a value of
4 \$59.9-million in 1989 dollars, as well, and that is an
5 8 by 500 plant. If you could just make note of those
6 figures, and then turn the page of Exhibit 144.

7 A. Just a moment, please.

8 Q. Certainly.

9 A. I've turned the page, thank you.

10 Q. If you turn the page, you will see an
11 excerpt from the Thermal Cost Review 2-4-1, "Primary
12 Plant OM&A Direct." And if you look at the second
13 column under item No. 4, "Improved Estimates, Current
14 Conditions," and under the heading "Millions of '89
15 Dollars Per Year," it says median estimate direct 28.6.

16 A. Yes.

17 Q. And if you turn the page to page 9 of
18 Exhibit 144, if you look at almost the same place on
19 that page, which is dealing with indirect OM&A costs,
20 you will see that the figure there is \$2.5-million in
21 '89 dollars.

22 Now, I have added those, the two figures
23 from the Thermal Cost Review, together and get
24 \$31.1-million in '89 dollars. And I have looked at the
25 results of Interrogatory 2.9.10, and it appears as

1 though the OM&A costs for a new plant are roughly the
2 same as for an existing plant. They are somewhat
3 smaller than Lambton, and it looks as though they may
4 be a little larger than Nanticoke, taking into account
5 the fact that Nanticoke is twice as large. So, is it
6 fair to say that the OM&A costs are roughly the same?

7 A. Yes.

8 Q. I would like to turn now to the fuel
9 costs. And again, dealing with a new plant versus one
10 of the existing plants, assuming the same environmental
11 constraints and assuming they burn the same fuel, is it
12 fair to say that the heat rates should be essentially
13 the same for the existing units and those that you
14 might construct in the future? And if that is so,
15 then, in effect, would not fuel costs be essentially
16 the same?

17 A. Excuse me a minute, I would like to
18 consult.

19 Q. Certainly.

20 ---Off the record discussion.

21 MR. TABOREK: Yes, the heat rates would
22 be about the same, if you replace with in kind.

23 MR. WATSON: Q. I'm sorry, I didn't --

24 MR. TABOREK: A. If you replace with "in
25 kind," the same type of generation.

1 Q. And as a result of that, the fuel
2 costs would be essentially the same?

3 A. Yes.

4 Q. If we could turn now to capital
5 costs.

6 A. Replace in what time period?

7 Q. During the life of the plant.

8 A. During the life, okay.

9 Q. Yes.

10

11

12

13

14

15

16

17

18

19

20

21

22

23

24

25

...

1 [10:37 a.m.] Just dealing with that comment for a
2 minute, Mr. Taborek, I guess I don't understand why it
3 would make a difference if the heat rate was the same,
4 if they are burning the same fuel, why would it make a
5 difference as to when this occurred?

6 A. Well, with heat rate, if you are
7 talking about replacing these plants when they meet the
8 end of their life 20 years from now, compared to
9 replacing them now, the conditions can be significantly
10 different. You are using, on the one hand, information
11 about Lakeview and Lambton say as they are now; you are
12 not using information about what state they are going
13 to be in 20 years from now, and that's where I have the
14 trouble.

15 Now, with heat rate, there is perhaps
16 another decade in which new technology may change, but
17 I think, maybe, for an identical plant, it may not be
18 too much different. But I would think the OM&A costs
19 and other costs could be markedly different for a
20 future Lambton or a future Lakeview than the ones we
21 are reporting here.

22 These were prepared with respect to
23 their operation over the remainder of their existing
24 life, not an extended life.

25 Q. And how would life extension make

1 these figures change?

2 A. Well, that's the whole question, that
3 you don't know. You cannot now meaningfully project
4 what those will be. And as I gave in my direct
5 testimony, the prudent way to do this, if you make a
6 judgment now, you gamble. You gamble everything on a
7 forecast and forecasts are not that reliable. So, it's
8 not a prudent thing to do.

9 The prudent thing to do is to make this
10 judgment at a future time when enough of the world has
11 evolved that you know what its maintenance and other
12 costs are, you know what kind of environmental
13 regulations have to be applied, you know what the
14 prices relevant to that fuel are at that future date,
15 and that could be different. And at that point you are
16 able to make a decision.

17 It is very risky to make a life extension
18 decision now because we have already, we believe,
19 extended the life of these plants to the maximum
20 prudent feasible limit.

21 Q. Now, if we could turn to capital
22 costs, Mr. Taborek. If you look at the next
23 interrogatory in the package, which is Interrogatory
24 No. 2.9.11, on page 13. I believe that table shows the
25 capital costs of Lambton in dollars per kilowatt as

1 331.

2 A. Yes.

3 Q. And if you add the figure for
4 scrubbers, that we saw earlier, of \$181, that would
5 give you a total of \$512, if my mathematics is correct?

6 A. Yes.

7 Q. Now, if we could turn to page 15 of
8 Exhibit 144 - again, an excerpt from the thermal cost
9 review - talking about the capital estimate for a 4 by
10 500 plant, you can see in the second column, the third
11 line under paragraph No. 2, capital cost is said to be
12 \$1,391.2 per kilowatt. If you turn over the page of
13 the same exhibit, you have a graph showing the two
14 figures comparing Lambton capital costs, in dollars per
15 kilowatt, with a new plant, in dollars per kilowatt,
16 and they are similar, 4 by 500 plants.

17 And you will note, just as an aside, I
18 had refurbishment there and I crossed that out. I am
19 talking about rehabilitation versus new construction.

20 Now, it seems to me, in looking at that
21 graph, that we have a substantial difference in costs
22 between rehabilitation and new construction; is that
23 fair?

24 A. Yes.

25 Q. Is it also fair to say that -- again,

1 I didn't see a line for this when I was looking at the
2 costs, but it appeared to me that there was no cost of
3 money involved in the figure of 1391 for the new plant.

4 A. I am not familiar with the details of
5 the thermal cost review. I think Panel 8 again would
6 be the panel to direct that to.

7 Q. I was simply referring to Column 1 of
8 page 15 of that exhibit.

9 A. Yes.

10 Q. And while it had figures for
11 construction, permanent materials, engineering,
12 overheads, contingency--

13 A. That's correct. There is no interest
14 there.

15 Q. --it appeared not to have an interest
16 figure. And if, in fact, the Lambton figure did have a
17 cost of money, that would make that comparison even
18 more favourable, would it not?

19 A. Yes.

20 Q. And in looking at rehabilitation or
21 life-extending a new plant, is it fair to say that when
22 you put parts in it today, often the parts that are put
23 in would be much better and would last longer than the
24 parts that were originally in there? If effect, you
25 are getting the benefit of new technology today?

1 A. No, I don't think I would agree to
2 that. In some instances, it may be true, and in some
3 instances, not.

4 Q. So I can't make a generalization, but
5 in looking at individual plants, we may find benefits
6 like that?

7 A. I think you are making a statement
8 that I can't give any evidence to support.

9 MR. WATSON: Thank you.

10 Mr. Chairman, I should say as I am going
11 along, that I did have the benefit of meeting with Mrs.
12 Formusa and some of the Hydro staff on Friday afternoon
13 for a considerable period of time, and as a result of
14 that, I think I have been able to focus some of these
15 questions. And hopefully, we should be able to deal
16 with them in a quicker fashion and be more efficient
17 with what this panel can handle.

18 Q. Panel, if we could now talk about a
19 technical issue, in a very general sense, and please
20 let me know if you don't think you are competent to
21 deal with this.

22 Let me give you a hypothetical question:
23 You have three identical units. Unit A is mothballed,
24 and by that I mean it is shut down with the equipment
25 properly laid up. Unit B is operated flat out, by that

1 I mean it's operating at full power except for
2 occasional outages.

3 MR. TABOREK: A. Base load operation, is
4 what you are referring to?

5 Q. Yes, that's precisely it, base load
6 operation.

7 And Unit C is operated with daily
8 cycling, daily start-up and shutdown.

9 Which unit would you expect to be in
10 better physical condition at the end of 40 years?

11 A. There are so many parameters
12 affecting the condition of a unit at any point in time
13 that I don't know how could you answer that question.
14 I mean, one could take talk at great length on factors,
15 but to give you an evidential answer, I think is a very
16 hypothetical question.

17 Q. Well, is it fair to say that laying
18 up a unit, or mothballing a unit, is less stressful and
19 would cause less physical deterioration than running it
20 flat out or cycling it?

21 A. Are these all identical units?

22 Q. Yes, they are all identical units.
23 Is that a fair statement?

24 MR. SNELSON: A. Yes. But there are
25 other factors which will come into play. An operating

1 unit will continuously have upgrades and improvements
2 made to it through normal maintenance and
3 rehabilitation procedures. The unit that is laid up
4 for a long time will not receive the benefit of those.

5 MR. TABOREK: A. Plus a unit that's been
6 mothballed will have been cycling intensively just
7 before it's been mothballed, because it would have been
8 a marginal unit.

9 Q. And cycling is more difficult on a
10 unit than base loading it?

11 A. Again, all other things being equal -
12 and that is not necessarily the case - then, yes.

13 Q. So, subject to the comments that Mr.
14 Snelson has made and you have made, it appears as
15 though there is a little bit of a hierarchy emerging
16 from this, that --

17 A. I think you are pushing our comments
18 too far. Our comments are that we really don't want to
19 attempt an answer to that. It is a far more complex
20 thing to describe than merely listing one parameter for
21 each of the plants and saying which is best. It's much
22 more complex than that.

23 Q. Would Panel 8 be able to provide me
24 more assistance with this scenario?

25 A. Well, I think they would have the

1 same difficulty. I know we frequently go to the
2 engineering people and ask questions, and we would ask
3 our questions in a much more detailed fashion than
4 this. I think they want to know operating histories
5 and conditions and future use, et cetera.

6 Q. Okay. Well, if we could turn back to
7 Interrogatory 2.9.11, which you will find at pages 10,
8 11, through to 14 of Exhibit 144. You will see the
9 interrogatory has two attachments to it. The first
10 one, on page 11, is called the Lakeview Condition
11 Assessment Finding Summary, and the one on page 12 is
12 the Lambton Condition Assessment Summary. If we could
13 just deal with the Lakeview condition assessment.

14 Just before we go through this, this is a
15 list of the major equipment deficiencies that were
16 found in Lakeview when it was recently assessed; is
17 that fair?

18 A. Yes.

19 Q. Now, if we look at the boilers, the
20 first item there is re heater tubing on units 3 to 8,
21 overheating damage. Is it fair to say that that type
22 of deficiency would only occur on a unit that was
23 either cycling or base loading; it wouldn't occur on a
24 mothballed unit?

25 A. I think I can give you one step based

1 on logic and then I would have to pass you on to the
2 Panel 8 for the details.

3 If the unit is not operating, it's
4 unlikely to get over overheated.

5 Q. Right, that was my point. And as a
6 result, it wouldn't experience this overheating damage?

7 A. That's right. But you have to now
8 ask questions about the performance of that unit in the
9 time before it was mothballed, at such a time when it
10 was probably operating in a peaking mode.

11 Q. Yes.

12 THE CHAIRMAN: Well, a mothballed plant
13 could have this kind of damage.

14 MR. TABOREK: It could have acquired this
15 kind of damage in its earlier life, yes.

16 MR. WATSON: Q. But there is no way that
17 mothballing it is going to make this worse and there is
18 no way that, while it's mothballed, it is going to have
19 this sort of damage occurring; is that fair?

20 MR. TABOREK: A. That's correct.

21 I did make a caveat to your initial
22 definition of aging in which I identified certain wear
23 that occurs strictly as a function of age, regardless
24 of whether it is operating or not. ...

1 [10:45 a.m] A unit that is mothballed -- while
2 mothballing is not necessarily perfect, and it is not
3 necessarily receiving the maintenance, as Ken said,
4 that other operating units may have. Therefore, as you
5 see, I am very reluctant to give any sort of blanket
6 assurances, just based on one parameter for each of
7 these types of units.

8 Q. And I certainly wasn't meaning to
9 imply that while the unit is mothballed, it wouldn't
10 suffer any deterioration. The only point I was trying
11 to make was that there would be significant -- or there
12 would be deterioration with a unit that was running, as
13 opposed to a unit that wasn't running?

14 A. There would be different types of
15 deterioration.

16 Q. That is correct. They would be
17 different, and in looking at the differences in those
18 deteriorations, the deterioration that occurs in an
19 operating unit is going to be more costly than the
20 deterioration which occurs in a mothballed unit?

21 A. Well, you used the definition of
22 "aging," which was over and above maintenance, and I
23 came back with a definition that there is aging and
24 there is maintenance, and that the performance and the
25 condition of the unit depends on both its age in

1 operation and the amount of maintenance it has
2 received. And if it is operating, it would receive
3 additional maintenance.

4 Q. Well, I guess there are two answers
5 to that, Mr. Taborek: One, you can certainly maintain
6 a mothballed unit; and, two, this is the Lakeview
7 assessment as of today--

8 A. Yes.

9 Q. --and it has been receiving some
10 maintenance over the years.

11 A. Yes.

12 Q. And it is still in this situation,
13 and Lakeview is -- I am not sure exactly what your
14 evidence was, but you indicated some hesitation when we
15 were talking about the economic obsolescence of
16 Lakeview.

17 A. Yes. You are aware that our cost
18 estimates for rehabilitating Lakeview have increased--

19 Q. Yes.

20 A. --over recent time, indicating again
21 the difficulty in forecasting how much maintenance a
22 unit requires because it has changed sharply over a few
23 years.

24 And again, you are, in effect, asking me
25 to make condition statements on simple parameters, when

1 very detailed assessments of stations have difficulty
2 in producing accurate, for the type of analysis you
3 appear to be leading to.

4 Q. If you could look just briefly at
5 Attachment 1, "The Lakeview Condition Assessment," can
6 you point out any of the factors, under either boilers,
7 turbines, generators or unit controls, that would
8 result while a unit was mothballed?

9 A. I think that I am not an engineer
10 familiar with the detailed condition of stations and I
11 think you should refer that to Panel 8.

12 Q. Okay. Thank you.

13 A. Looking down the line, Unit Controls.

14 Q. Well, based on your answer about
15 Panel 8, I am not sure I want to get into that with
16 you. I would be pleased to if you want to discuss it
17 more.

18 A. No.

19 Q. But in fairness to you --

20 A. I would agree. Panel 8 are the
21 authorities.

22 Q. Yes. If you could help me with just
23 one thing you said in your evidence, before we move on.

24 I understand the original estimate for
25 Lakeview, I believe, was just over \$1-billion, and I

1 think the estimate for Lambton was just over
2 600-million.

3 In your evidence, you mentioned a figure
4 of \$2.4-billion.

5 A. Yes.

6 Q. And that was for both of them?

7 A. Plus two scrubbers.

8 Q. Plus two scrubbers.

9 A. Yes. And if I may correct you, the
10 original estimate for Lakeview was less than 1-billion.
11 1-billion was approximately the committed number and
12 there were much lower estimates before that. As they
13 went through the inspection program on the station, the
14 number was revised before it was committed.

15 Q. Thank you. So, the current figure,
16 the figure as of today, is \$2.4-billion, which includes
17 the rehab and scrubbers?

18 A. Yes. It includes Lakeview rehab,
19 Lambton rehab, and two scrubbers at Lambton.

20 Q. Yes. Thank you. I assume from your
21 answers that costs have gone up since commitment of
22 rehab; is that correct?

23 A. That is correct.

24 Q. And is that a result of your
25 continuing assessment of the units, and in effect,

1 discovering more wrong with them than you originally
2 thought?

3 A. Again, I would refer you to Panel 8
4 for a detailed condition report on Lakeview.

5 Q. Do you have any information on why
6 costs have gone up since commitment?

7 A. I believe it is many factors and I am
8 not an expert in those factors.

9 Q. I am not asking for an explanation of
10 the factors. Could you just tell me what the factors
11 are, so I know what to probe with Panel 8; to the best
12 of your knowledge, what those factors are?

13 A. Excuse me just a moment, please.

14 Q. Sure.

15 MR. SNELSON: A. I don't think we can
16 help you very much. I mean, clearly, you can divide
17 them into two factors, but for the ratio between them,
18 I don't think we can help you.

19 The two factors would be that new things
20 are found that require fixing and that the cost of
21 fixing the things that you have found is more expensive
22 than you thought.

23 And the difficulties of working around
24 existing equipment in an existing station make cost
25 estimating for rehabilitation a particularly difficult

1 exercise. But I think, beyond that, we cannot help
2 you, but Panel 8 probably can.

3 Q. Just a quick question on
4 clarification. The \$2.4-billion; that is the cost
5 today or is that the committed cost?

6 MR. TABOREK: A. That is the present
7 money allocated for those programs and that is what we
8 expect it to cost.

9 MR. WATSON: Mr. Chairman, I had a
10 further series of questions dealing with plant
11 conditions and the prospects for economic life
12 extension of those plants, as well as questions on the
13 conversion of Lennox to another fuel.

14 Based on what I have heard the panel say
15 this morning and, also, more importantly, my
16 discussions with Mrs. Formusa and her staff on Friday,
17 I will be deferring those questions to Panel 8.

18 THE CHAIRMAN: All right.

19 MR. WATSON: Mr. Chairman, that deals
20 with the area of plant life extension to the extent
21 that I can deal with it during this panel.

22 The next major area I would like to turn
23 to is that of environmental concerns, and Mr. Logan has
24 another package of documents.

25 THE CHAIRMAN: Mr. Lucas, I suggest, for

1 the purpose of the record.

2 MR. WATSON: Mr. Lucas. I'm sorry. My
3 apologies, Mr. Lucas.

4 THE CHAIRMAN: Mr. Logan was here Friday;
5 he's your colleague. (Laughter)

6 MR. WATSON: That's right.

7 THE CHAIRMAN: Do we have an new exhibit?

8 MR. WATSON: We do.

9 THE REGISTRAR: 145, Mr.Chairman.

10 THE CHAIRMAN: Thank you. Can we have
11 it?

12 ---EXHIBIT NO. 145: Environment reference material to
13 be used in M.E.A. Panel 2
cross-examination.

14 MR. WATSON: And again, for the
15 intervenors, there is a similar package available at
16 the front desk.

17 Q. Panel, as I indicated, we will be
18 turning to environmental concerns. Perhaps now, Ms.
19 Ryan, you and I can have some question and answers.

20 The first thing I would like to do is
21 look at the general topic of current emissions versus
22 current regulations.

23 MS. RYAN: A. Okay.

24 Q. And if you turn to the first graph in
25 Exhibit 145, you will see a figure of, dealing with

1 1989 emissions as a per cent of allowable emissions.

2 It appears to show that radioactivity is
3 less than 1 per cent of the allowable emissions;
4 whereas, the SOx and NOx combination is a very high
5 percentage, about 83 per cent of current emissions.

6 Does that accord with your understanding
7 of the situation?

8 A. That's correct.

9 Q. Still looking at that graph, Ms.
10 Ryan, could you help us with where the actual emissions
11 and limits on emissions for particulates and other
12 major pollutants would fit into this type of graph?

13 And just generally, would they be closer
14 to the left of radioactivity; that is, very small in
15 comparison to allowable emissions, or very high? Let's
16 deal first with pollutants.

17 A. Pollutants?

18 Q. Or particulates. I'm sorry.

19 A. I believe, one of the graphs, the
20 next graph that you have, gives a plot for
21 particulates. I think what you have to appreciate is
22 that for radioactive emissions from nuclear stations,
23 and for acid gas emissions from fossil stations, we
24 have emission caps, an acceptable amount that can be
25 emitted.

1 For a lot of the other emissions, it is
2 an emission rate based on design, and so, during the
3 design of the station, we are licensed based on a
4 calculation of what our emissions will be and what the
5 resultant groundlevel concentration might be, and then
6 there are ambient criteria which are to be met.

7 Q. Okay.

8 A. But those ambient criteria include
9 all industry.

10 Q. Thank you. And in Graph 1, we have
11 indicated a per cent of allowable emissions. Are there
12 any other emissions where there are current caps or
13 standards which we could fit into that type of graph,
14 as opposed to dealing with them on an ambient level?

15 A. Again, as I mentioned in my direct
16 evidence, we have opacity limits which are measured at
17 stack, and that is a limit.

18 Q. Okay.

19 A. Thermal emissions to water have
20 temperature emission limits.

21
22
23
24
25

...

1 [11:00 a.m.] Q. And where are you in meeting those
2 limits? Where would you be on this graph? Are you
3 pushing the envelope or do you have very safe margin on
4 those, where there are limits?

5 A. It varies, depending on station
6 operation to plot it this way, but generally, we meet
7 the opacity limit 97/98 per cent of our operating time;
8 and for thermal emission limits across all stations, we
9 would meet the limit 99 plus per cent of the time.

10 Q. And that is a bit different from what
11 this graph is saying though, isn't it?

12 A. Yes.

13 Q. That is a bit like apples and
14 oranges, because when you are looking at the SOx and
15 NOx here, you are probably meeting them most of time,
16 as well, but it doesn't give the same idea, does it?

17 A. No. And I don't, right here, have
18 the information to plot it in the same way you have
19 these plotted.

20 Q. Ms. Ryan, if you could turn just a
21 bit out of order to page 9, Exhibit 145, you will see
22 about three-quarters of the way down the page, and this
23 is page 10 of the State of the Environment Report for
24 1989, there is a paragraph that starts "Any initiatives
25 to reduce NOx levels..." Do you have that?

1 A. Yes.

2 Q. And it goes on to say that three
3 fossil fuel generating stations, Nanticoke, Lakeview
4 and Lennox, currently exceed Canada's existing
5 emissions standards (258 nanograms per joule) as NO(2)
6 for coal and 129 nanograms per joule as NO(2) for oil
7 for NOx.

8 Is it fair to say that these standards
9 were adopted after those units were built?

10 A. Yes, that's correct.

11 Q. However, they are currently operating
12 with emissions which are above those a new unit would
13 have to meet?

14 A. Yes. Though for our stations, we are
15 generally governed by provincial regulations and so we
16 would have to meet provincial requirements which these
17 stations do.

18 Q. And I understand that Nanticoke
19 already has low NOx burners; is that correct?

20 A. That's correct.

21 Q. And in fairness, that would lower the
22 NOx emissions by about 30 per cent?

23 A. Around 25 to 30 per cent.

24 Q. Do you have any idea of what the
25 emissions are from Nanticoke, after the low NOx burners

1 have been installed? Are they still above the 258
2 nanogram per joule limit?

3 A. Yes, they are.

4 Q. Do you have any idea of, just
5 roughly, where they are above the limit? Are they
6 close?

7 A. They would still be above the limit.
8 I don't have the exact numbers with me.

9 Q. If you don't know, just tell me. I
10 don't want to push you.

11 A. I don't know the numbers off the top
12 of my head.

13 Q. Could you tell me whether they are
14 close?

15 MR. TABOREK: A. No, they are --
16 If I may?

17 MS. RYAN: A. Sure, go ahead.

18 MR. TABOREK: A. You would need
19 selective catalytic reduction on a number of units to
20 meet this regulation. This one, I think, Judy is --

21 MS. RYAN: A. No, this is the existing
22 federal limit and--

23 MR. TABOREK: A. Oh, the existing, okay.

24 MS. RYAN: A. --it isn't as stringent.

25 But I don't know our emissions in

1 nanograms per joule, I know them in parts per million,
2 and they are running about 450 parts per million, but I
3 can't do the conversion for you right here.

4 Q. I think we will have to take that. I
5 am not equipped to make that conversion either.

6 Ms. Ryan, if you could turn to figure 2,
7 which is the percentage of allowable ambient
8 concentrations. First of all, these figures, as
9 indicated, were taken from the 1989 State of the
10 Environment Report and the Stack Emissions Testing at
11 Lakeview, Interrogatories 2.15.7 and 2.14.70.

12 Now in looking at those figures, they
13 seem to indicate a very high allowable ambient
14 concentration for SOx, NOx, particulates, and a very
15 low concentration for radioactivity. Is that the
16 current reality?

17 A. It's the current reality. I think
18 there are a couple of things you need to recognize
19 here. These numbers were obtained by taking stack gas
20 emissions as measured, and going through a model
21 calculation to see what the impingement concentration
22 would be in the environment, based on our measured
23 stack emissions. And the model looks at worst-case
24 meteorology in that range, so these are correct, based
25 on the model. But they don't represent what our

1 emissions would look like in the environment on
2 average.

3 Q. And is it also fair to say that the
4 radioactivity is a worst-case number?

5 A. You are comparing different things,
6 because for our nuclear stations, we have emission
7 limits and so we measure our emissions against a limit.
8 And they were specified at the time the station was
9 designed, so technology was available and affordable
10 and the stations were designed to meet that level.

11 Our fossil stations were designed to meet
12 the laws at the time, but the emissions that you see
13 here were not recognized as being the environmental
14 concern that they are today.

15 Q. Well, that's certainly correct, Ms.
16 Ryan. I don't mean to be unfair, and we could go a
17 step further and point out that, in looking at SOx, the
18 use of scrubbers could reduce that figure by as much as
19 a factor of, maybe, 8, 9 or 10. Is that fair?

20 A. That's correct.

21 Q. Which would bring the figure down to,
22 maybe, somewhere between 8 and 10 per cent?

23 A. Yes.

24 Q. And also, low NOx burners could
25 reduce the NOx emissions, as you said, by 25 to 30 per

1 cent?

2 A. Yes. If you take into account,
3 though, that the regulation is also stepping down, our
4 NOx acid gas and SO(2) emissions are always going to be
5 a fairly high percentage of regulation in the
6 foreseeable future.

7 Q. Which is what we are showing on
8 figure 1 of this same exhibit?

9 A. Yes.

10 Q. And you don't anticipate the same
11 situation will occur with respect to the nuclear
12 plants?

13 A. We expect that the allowable emission
14 limits will be reduced in the next few years, but we
15 don't know what they will be reduced to, so our
16 emissions as a percentage of regulatory limit may go
17 up, even though our emissions are not going up.

18 Q. And also dealing with NOx, again,
19 just to be fair to you, the use of SCR would probably
20 reduce the NOx emissions by another factor of 4?

21 A. SCR could reduce NOx emissions in the
22 ballpark of 80 per cent.

23 Q. And also, looking at the
24 particulates, if you repaired the precipitators at
25 Lakeview, that would reduce certainly the particulates

1 and maybe some of the other pollutants; is that fair?

2 A. That's correct.

3 Q. Do you have any idea of what sort of
4 factor that would reduce the particulates by, if the
5 precipitators were corrected?

6 A. Again, it would depend on the design
7 efficiency of the precipitators. If you can select
8 various efficiencies, depending on what type of
9 precipitators you put in. So I can't give you an
10 answer, but, certainly, the particulate would be
11 reduced.

12 Q. Do you know what the design
13 efficiency is of the existing precipitators?

14 A. No. Again, that's something that the
15 Panel 8 people would have the specific numbers.

16 Q. We will deal with that then, thank
17 you.

18 So, Ms. Ryan, in going through some of
19 the improvements that I have made by discussing
20 scrubbers, low NOx burners, SCRs, precipitator
21 adjustments, things like that, we would be able to
22 reduce the figures in graph 2, but we would still have
23 a situation - even if we could snap our fingers and
24 have this all done today - we would still have a
25 situation where SOx, NOx, particulates, would be in the

1 order of 8 to 10 per cent or more, versus, shall we
2 say, radioactivity, which would be less than 1 per cent
3 as of today?

4 A. Yes.

5 Q. Ms. Ryan, we have been looking at
6 some of the current realities. If I could turn now to
7 some future environmental limits and their impact on
8 the current system.

9 Now, I understand from looking at an OEB
10 interrogatory, that part of the mandate of Hydro's
11 environmental decision is to attempt to anticipate
12 changes in future environmental regulations and their
13 impact on Hydro's operations. Is that fair?

14 A. Yes.

15 Q. And I understand that there have been
16 a number of proposals to decrease allowable emissions
17 from fossil-powered plants. Examples include the NOx
18 protocol, CO(2) emissions reductions, solid waste
19 initiatives, VOCs, particulates, to just quote some of
20 them. And I assume you are familiar with all of those?

21 A. Yes.

22 Q. Now what I would like to do is look
23 at some of these new emission limits which have been
24 proposed and see what effects they would have on the
25 operation of Hydro's existing fossil units.

1 And this is of particular interest if we
2 are trying to find out what would happen if Hydro were
3 going to meet load with more of its existing fossil
4 units; that is, if they were going to life-extend them
5 and base load them. And in looking at this, what I
6 would ask you to do, in effect, is look at case 26,
7 which is, in effect, the fossil option, if you will.
8 It, as I understand, does not have any nuclear in it.
9 And if we could just adopt that as a bit of a surrogate
10 for looking at this scenario, I think that might be of
11 some assistance.

12 If we could turn first to carbon dioxide
13 emissions. I understand that right now there are no
14 limits on carbon dioxide emissions by Hydro; is that
15 correct?

16 A. That's correct.

17 Q. And I understand that there has been
18 a lot of concern about carbon dioxide emissions and, in
19 fact, there have been several regulatory groups which
20 have proposed a 20 per cent reduction in CO(2)
21 emissions by the year 2005, and 50 per cent reduction
22 by 2020; is that correct?

23 A. Yes. But it is also fair to say that
24 there has been great concern at whether Ontario or
25 Canada could meet those limits. And there has been a

1 lot of discussion whether we are looking at reductions
2 or stabilizing by the year 2000.

3 Q. When you say stablizing, just staying
4 at the current level?

5 A. Yes.

6 Q. And the current level for what year.

7 A. I believe it is, I am not sure, '88,
8 '89.

9 Q. And in fairness, I assume that part
10 of the difficulty is because, as I understand it, there
11 is no technology currently available to deal with
12 CO(2)?

13 A. That's right. There is no scrubber
14 technology that would be cost effective, as there is
15 for NOx or SO(2).

16

17

18

19

20

21

22

23

24

25

...

1 [11:15 a.m.] Q. If you turn to page 5 of Exhibit 145,
2 you will see a graph entitled at "Atmospheric Emissions
3 CO(2) for the Medium Load Forecast." This is your
4 graph taken from page 5.37 of the environmental
5 analysis. And of course, as goes without saying, if
6 there is any difficulty with this graph, I am sure you
7 will let me know, but I hope it's an accurate
8 representation of that graph.

9 I notice that you have page 5.37 in front
10 of you, so I assume that the graph is accurate.

11 A. Yes, it's fine.

12 Q. In looking at this, you can see that
13 case 26 is plotted assuming medium load growth, and by
14 the year 2014, the CO(2) emissions are roughly
15 two-and-a-half times the proposed 20 per cent limit; is
16 that fair?

17 A. Yes.

18 Q. And I suppose it's also fair to say,
19 in looking at the graph that's there, that the CO(2)
20 emissions would continue increasing beyond the year
21 2014, based on what we know about the components of
22 Case 26; it is a fossil option.

23 MR. SNELSON: A. Well, you started your
24 questions saying this was a surrogate for increased
25 operation of the existing system.

1 Q. Yes.

2 A. And to some degree your premise may
3 be correct. But ultimately, it has to break down,
4 because there is only a certain amount of existing
5 coal-fired plant in the existing system. And if you
6 run it flat out to 24 hours a day, there is only so
7 much coal it can burn and so much CO(2) it can produce.
8 So, eventually, this runs out of capability of
9 supplying the energy that's demanded and then the CO(2)
10 projection becomes meaningless.

11 Q. Yes. Then it would decrease at some
12 time.

13 A. Your premise was life extension of
14 existing facilities, I believe.

15 Q. Yes.

16 A. And presuming indefinite life
17 extension, if that were feasible, then it would
18 eventually, from existing facilities, stabilize. But
19 you still have the question as to where would the
20 additional energy be generated that's demanded, that is
21 not answered.

22 Q. Yes, I understand that. And just to
23 put it in numbers so that I am not misrepresenting the
24 situation. I understand that, according to the plan,
25 Hydro plans on retiring about 6.7 gigawatts of coal

1 production during the 25-year planning horizon, and in
2 Case 26, they are planning on building 7.4 gigawatts of
3 new base load coal.

4 So, on the assumption that we were
5 life-extending the coal plants, there is a reasonable
6 approximation there, that while it isn't one-to-one, it
7 is close, within .7 of a gigawatt. But I certainly
8 take your point that, past 2014, this isn't going to
9 continue forever, simply because -- well, I don't need
10 to repeat what you said.

11 Q. Now, also, page 5 deals with the Case
12 15, and, again, from the same reference, it produces
13 the graph for Case 15. You note that, by the year
14 2005, even Case 15, which has a nuclear component, as
15 well as a fossil component, involves just barely
16 meeting the proposed limit, although it does decrease
17 as the nuclear units come on line later in the case,
18 later in the planning life. That's my understanding of
19 that; is that fair?

20 MS. RYAN: A. Yes.

21 MR. SNELSON: A. You referred to it as a
22 proposed limit. Its status in the DSP is an
23 illustrative target. Now, that may seem like a fine
24 line, but it was the terminology, illustrative target,
25 was taken from a document produced by the federal and

1 provincial Ministers of Energy, and I believe it's
2 somewhat different and perhaps not quite so definitive
3 as a proposed limit.

4 DR. CONNELL: That is, however, the
5 language used in the original figure, 5.18.

6 MR. SNELSON: I believe that we misspoke
7 ourselves, if you like, and the main document refers to
8 it as illustrative target. So, yes, you are correct.
9 We have used two different terminologies.

10 MR. WATSON: Q. Is it fair to say, in
11 looking at Case 15, that if, in fact, you did
12 life-extend a large number of your coal plants, which
13 is currently not the plan for Case 15, that you would
14 not be achieving either the illustrative target or the
15 proposed limit of 20 per cent?

16 MR. SNELSON: A. That would depend upon
17 how they were used.

18 Q. Well, certainly, if they were used in
19 base load, you wouldn't achieve it; is that fair?

20 A. If they were used in base load, we
21 would not achieve it.

22 Q. And then we would get to intermediate
23 load, and that, of course, is going to be a function of
24 how often they are run and what capability factors; is
25 that fair?

1 A. What capacity factors, yes.

2 Q. What capacity factors.

3 And in looking at Case 15, there appears
4 to be, if you will, a blip in the years 2001 to 2004,
5 followed by a decrease in CO(2) emissions. Is it fair
6 to say, in looking at that blip, that, first of all,
7 Case 15 involves building no new coal plants?

8 A. Case 15 doesn't build new coal
9 plants, that's correct.

10 Q. That blip in CO(2) emissions would be
11 due to increased usage of existing fossil units during
12 that time, and possibly even increased use of some
13 combustion turbines?

14 A. Yes.

15 Q. And all of this results -- sorry,
16 before I get to that. And this increase results from
17 continued load growth, combined with a long lead time,
18 to bring on the new nuclear plant in Case 15?

19 A. Yes, but somewhat offset by demand
20 management, Manitoba purchase, hydraulic purchases, et
21 cetera.

22 Q. And I would like to get into some of
23 those items in a few minutes, purchases and things like
24 that.

25 So, just finishing up with Case 15. If,

1 in fact, the nuclear approval for Case 15 is delayed,
2 that would make it more difficult for Case 15 to meet
3 the CO(2) target; is that fair?

4 A. Yes.

5 Q. Now, in fairness, I suppose you could
6 also say that it might be possible to achieve a CO(2)
7 reduction without building nuclear, if you burned
8 enough natural gas; is that fair?

9 A. You can substitute natural gas for
10 coal. If you were to do that, then you approximately
11 halve the CO(2) emissions per unit of energy produced,
12 per unit of energy changed from coal to natural gas.

13 Q. And another trade-off would be that
14 the cost would be very high?

15 A. Yes.

16 Q. And as you were mentioning a few
17 minutes ago, another way to deal with this would be to,
18 in effect, purchase power, to deal with the CO(2)
19 limit?

20 A. Yes.

21 Q. And just before we get into that, I
22 assume that the philosophy of CO(2) targets, or limits,
23 is to produce reduction in world-wide emissions of
24 CO(2); is that a fair statement?

25 A. I would presume that that is the -- I

1 don't presume it. That is the motivation that I
2 understand behind CO(2) limits.

3 Q. And that, of course, is why we have
4 inter-provincial, federal, international conferences
5 and discussions dealing with this issue?

6 A. Yes.

7 Q. And it's also fair to say that
8 reducing emissions from just one area, or just one
9 industry, and simply substituting emissions from
10 another area is not in keeping with this philosophy and
11 laudable objective it's trying to achieve?

12 A. I'm sorry, I missed the question.
13 Can you repeat it?

14 Q. Is it fair to say that reducing
15 emissions in one area and substituting them with
16 emissions in another area is not meeting that objective
17 or that philosophy?

18 A. If the emissions in the other area
19 are equal or higher, then that is correct.

20 Q. Now, it's certainly trite that Hydro
21 could just simply reduce the use of their only fossil
22 units and purchase more fossil power from another
23 source, and while this would reduce Hydro's CO(2)
24 emissions, it's not going to achieve this more global
25 purpose of dealing with the total amount of CO(2)

1 emissions. I assume that's a fair statement.

2 A. I believe that is true, assuming that
3 the purchased power would have equivalent CO(2)
4 emissions or higher.

5 Q. Therefore, it seems to me, in
6 assessing Hydro's ability to meet a target or a limit
7 on CO(2) reductions, it's more realistic to consider
8 all sources of power provided by Hydro, whether
9 internally generated or externally generated. And in
10 saying that, I would like to talk about the recent past
11 at Hydro. I understand that Hydro has made significant
12 purchases of power from the U.S. in order to stay
13 within certain limits, emissions limits; is that
14 correct?

15 MR. BARRIE: A. You're moving away from
16 CO(2) now, into acid gas?

17 Q. Well, now that you mention it, let's
18 deal with acid gas.

19 A. We haven't made any purchases to
20 respect CO(2).

21 Q. But in making purchases to deal with
22 acid gas, you would also be dealing with CO(2) just as
23 necessary bi-product, would you not?

24 A. It would influence CO(2) as well,
25 yes. Any time you reduce fossil production, you will

1 affect CO(2), yes. But that wasn't the purpose of the
2 purchase.

3 Q. So, the purpose of the purchase was
4 to reduce acid gas?

5 A. It was, yes.

6 Q. Well, while the purpose was to reduce
7 acid gas, I guess it's fair to say that you did also
8 achieve another objective, you reduced your CO(2)
9 emission. So, if anyone was monitoring it, you could
10 say, "Well, we have less CO(2) emission as a result of
11 this purchase as well." Wouldn't that be fair?

12 A. Except you used the word "objective"
13 in the middle of that sentence. That wasn't an
14 objective.

15 Q. Quite correct. You would achieve a
16 result?

17 A. Yes, a side effect.

18 Q. Side effect. The power that you were
19 purchasing, that was from the United States, was it
20 not?

21 A. Most of it, yes.

22 Q. And most of that power would be
23 coal-fired generation; would it not?

24 A. When you purchase power, you do not
25 know for certain where that power was generated. I

1 think it is fair to say, however, that the majority
2 that we purchased would be produced by coal-fired
3 generation.

4 Q. I wasn't asking you for a precise
5 figure, but it is fair to say that, as you said, that
6 the majority of it would be coal?

7 A. When one looks at the plant mix of
8 our of neighbours with power for sale, yes, that's
9 probably true.

10 Q. And, in effect, what we are doing
11 with that is we are just, in effect, shifting the
12 emissions from one jurisdiction to another, if you
13 will. Isn't that fair way of looking at that?

14 A. That is correct, yes.

15 Q. Now, turning to another area, you
16 mentioned purchases --

17 THE CHAIRMAN: If you are going to turn
18 to another area, we probably should take the morning
19 break.

20 MR. WATSON: Certainly, Mr. Chairman.

21 THE REGISTRAR: This hearing will recess
22 for 15 minutes.

23 ---Recess at 11:32 a.m.

24

...

25

1 ---On resuming at 11:50 a.m.

2 THE REGISTRAR: The hearing has again
3 resumed. Please be seated.

4 MR. WATSON: Q. Panel, we were talking
5 about carbon dioxide emissions and I would like to
6 continue. We just finished talking about purchases and
7 I would like to turn now to NUGs.

8 If you look at the diagram which we were
9 referring to, which is No. 5, you will see Case 15, as
10 well as another graph that says Case 15 plus NUGs.

11 As I understand it, from figure 4.1 of
12 the environmental analysis, which is on page 6 of
13 Exhibit 145, we can see the annual atmospheric
14 emissions from NUGs for NOx, SOx and CO(2), and --
15 well, we see NOx and SOx. The CO(2) line was very
16 faded and didn't come through. Perhaps we could
17 jointly draw that in now.

18 You can see that there is, for our
19 purposes, there is a break at the line that is numbered
20 2 on the vertical axis over the year 2003. The CO(2)
21 line goes, basically, from that break to just under 3
22 on the vertical scale.

23 And I believe, Ms. Ryan, you have figure
24 4.1 in front of you from the actual document and--

25 MS. RYAN: A. Yes.

1 Q. --I think that is correct, the line
2 that I have described. It is almost a straight line?

3 A. Yes.

4 MR. WATSON: It is in the environmental
5 analysis, as opposed to the DSP, Figure 4.1 on page
6 4.3. And as you will see, the line is a light yellow
7 line. And unfortunately, it didn't photocopy very
8 well, Mr. Chairman.

9 THE CHAIRMAN: All right. We have it.

10 MR. WATSON: Q. You will see for the
11 year 2014, the CO(2) emissions for NUGs are
12 approximately 3 teragrams per year and I understand
13 that Hydro's emissions in 2014 are about 13 teragrams
14 per year for Case 15. Is that correct, Ms. Ryan?

15 MS. RYAN: A. From the graph yes, it
16 appears correct.

17 Q. Okay. Before I go any further, it is
18 fair to say, in dealing with NUGs, that some of the
19 NUGs are co-generation items which produce products
20 other than electricity, and therefore, it is not fair
21 to charge all of their emissions to production of
22 electricity. But still, it is important to look at
23 NUGs and their contribution to the effects of
24 atmospheric emissions; is that fair?

25 A. They would have to be considered.

1 Q. Yes. And in looking at page 5, which
2 is the Case 15, plus the NUG values added to it, it
3 seems quite clear that any further expansion of NUGs
4 would -- or a more rapid expansion of NUGs could result
5 in a situation where the proposed target might not be
6 met?

7 A. I think there are a couple of things
8 that have to be noted here. One is that it is a
9 proposed target and the more prevalent discussion now
10 is in stabilization at the 1990 levels by 2005. The
11 other is that NUGs would be a separate industry and
12 would not be expected to be included within the Ontario
13 Hydro cap for any given emission limit.

14 MR. SNELSON: A. The other comment I
15 would like to add is that whether more NUGs lead to
16 more CO(2) depends on what they substitute for.

17 Q. Could you expand upon that?

18 A. If you develop more NUGs that emit
19 CO(2) and less hydraulic that does not emit CO(2), then
20 CO(2) will go up.

21 If you develop more NUGs using natural
22 gas as co-generation, instead of using existing
23 coal-fired plant, then CO(2) will go down.

24 Q. Yes. Well, Ms. Ryan, you are making
25 the point that the targets or the caps apply to Hydro

1 and that NUGs are a separate industry.

2 If, in fact, we adopt that sort of
3 philosophy or thinking, then we are back to the
4 situation that we were talking about earlier, when, in
5 fact, the CO(2) target is in response to a global
6 concern and we are trying to deal with CO(2) emissions
7 throughout, not only the province, but the country and
8 the continent. In effect, if Hydro is saying, well,
9 the NUG emissions do not count against it, then
10 wouldn't it be fair to say we do not really have an
11 accurate assessment of what the total emissions are
12 from the production of electricity?

13 MS. RYAN: A. I think you have to look
14 at it much more broadly than the production of
15 electricity, and that it is recognized that various
16 industrial sectors have emissions. So, what the
17 province or the country or the world, as a whole, has
18 to do is determine what is an acceptable cap and then
19 break it down ultimately into the industrial sector.

20 And so, I am not saying that NUG
21 emissions of CO(2) would be ignored. They would be
22 included in a larger perspective which would look at
23 each industrial sector and determine what an
24 appropriate limit would be for each sector for Ontario
25 and Canada to meet its goal. So, it would be

1 considered, but not by Ontario Hydro.

2 Q. Just before we leave this, just so I
3 am clear, the 20 per cent proposed target; is that an
4 overall target on everyone, or is that just a Hydro
5 target?

6 A. No. That was discussed as a target
7 at an international protocol and it has not been agreed
8 to by a number of governments, and our government is
9 one of them, but it was looked at as the way we should
10 be going. But certainly, nothing definite has been
11 set.

12 Q. Okay.

13 A. But it is not an Ontario Hydro
14 target; it is a far broader discussion point.

15 Q. Yes. If we could turn to the
16 consideration of acid gases. You will see the next
17 page of the exhibit, page No. 7 of Exhibit 145 deals
18 with emissions of total acid gases under the median
19 forecast, and in particular, it shows Case 26, as well
20 as Case 26 with NUGs.

21 I understand from Case 26, that with
22 scrubbers and low sulphur coal, you can meet the
23 current SO(2) limits under Case 26; is that fair?

24 MR. SNELSON: A. I am not sure whether
25 low sulphur coal is sufficient. There may, in some

1 cases in Case 26, be some assumptions about burning
2 natural gas, but Case 26 can meet the emission limits
3 with scrubbers and low sulphur fuels.

4 Q. Okay. My question was posed dealing
5 with scrubbers and low sulphur coal, which you
6 answered, but you have brought in a new topic of
7 natural gas. Could you expand upon that and how that
8 impacts on Case 26?

9 A. One of the strategies to meet acid
10 gas emissions, which is higher cost than some of the
11 other strategies, is to burn natural gas in existing
12 plants. And natural gas, being a fuel which has
13 virtually zero sulphur, then that is a very effective
14 way of cutting down sulphur dioxide emissions.

15 Q. Ms. Ryan, we were talking earlier
16 about the mandate of the Environmental Division.

17 These current limits, as far as the
18 future is concerned, appear to stay constant after
19 1994. Can you help us as to where you think these
20 limits are going to go in the future? Are they going
21 to stay constant forever after 1994?

22 MS. RYAN: A. Certainly, based on the
23 NOx/VOC management plan or protocol that you have
24 referred to, it looks like there will be reduction
25 requirements for NOx emissions which are part of total

1 acid gas. The way in environmental concerns have been
2 going, it is fair to say that a further stepdown of
3 acid gas limits in the future may happen.

4 Certainly, we do not have any regulations
5 underway for the stepdown, but discussion has indicated
6 that it may be considered in the future.

7 Q. And one of the protocols you were
8 referring to was the NOx protocol, which calls for
9 freezing of NOx emissions at the '87 level, I believe?

10 A. Yes.

11 Q. And for Hydro, that would be 62
12 gigagrams per year of NOx; is that correct?

13 A. That is correct. But in addition to
14 that, there is a Ministry of the Environment initiative
15 known as the NOx/VOC Management Plan, which is looking
16 at NOx, as well.

17 Q. I was just about to refer to that,
18 and they are talking about a lower limit on NOx of 40
19 gigagrams per year; is that fair?

20 A. They haven't specified a limit. The
21 Management Plan looks the at a reduction of NOx in
22 Ontario as a total, and various sectors having to step
23 down. We do not have agreement with the Ministry, yet,
24 on what ours is going to be.

25 Q. Well, the figure of 40 gigagrams per

1 year falls out of some of these current limits, does it
2 not, because after 1994, the total amount is 215
3 gigagrams, I believe--

4 A. Yes.

5 Q. --for total SOx and NOx?

6 A. Yes.

7 Q. And 175 for SOx?

8 A. Yes. That is correct.

9 Q. Subtracting those two would leave a
10 limit of 40 gigagrams for NOx; is that fair?

11 A. That is correct.

12 Q. Dealing with NOx, if you would turn
13 to the next page which is another graph, entitled,
14 "Atmospheric Emissions NOx for the Median Load
15 Forecast" again, this is taken from your data and your
16 graphs, and if there is any correction, please let me
17 know.

18 This figure shows NOx emissions for Case
19 26 at median growth and it shows that the emissions are
20 within the 62-gigagram-per-year limit, but appear to
21 exceed the 40-gigagram-per-year limit. Is that fair?

22 A. Yes, though 40 is not yet a limit.

23 Q. I understand that; however, by 1994,
24 you will have total limit of 215 on SOx and NOx and a
25 limit of 175 on SOx?

1 A. That is correct.

2 Q. So, that if SOx are pushed to the
3 total, you will have, in effect, a limit of 40 on NOx?

4 A. That is correct.

5 MR. SNELSON: A. I don't believe that is
6 the correct interpretation of the current regulation.

7 The current regulation, I believe,
8 permits more than 40 gigagrams of NOx, provided we emit
9 a correspondingly lesser amount of SOx.

10 Q. Yes. No question, Mr. Snelson. I
11 wasn't meaning to imply anything but that. I mean,
12 your total is 215,000, but SOx, in fairness, has been
13 singled out as having a limit within that 215?

14 A. Yes.

15 Q. And therefore, if you push that
16 limit, you would have necessity to find a NOx limit?

17 A. If you are on the maximum for your
18 SOx, yes.

19 Q. Yes, okay. And if, in fact, you do
20 push that limit and you are at your 40 gigagrams per
21 year for NOx, you are not going to be able to meet that
22 with Case 26, are you?

23 MS. RYAN: A. We would meet our
24 regulatory limit, because there is control technology
25 for NOx that can be installed.

1 Q. So, you would either have to increase
2 your costs by installing the NOx technology or not run
3 some of the offending plants?

4 A. That is correct.

5 MR. SNELSON: A. The correct plan meets
6 the current regulation, so to the extent that the plan
7 15 has more than 40 gigagrams of NOx, it has less than
8 175 gigagrams of SOx, so that it meets both the total
9 limit and the SO(2) limit.

1 [11:02 a.m.] Q. One other question about Case 26.

2 Isn't it fair to say that all of the new units proposed
3 for Case 26 have SCR installed, NOx reducing SCR?

4 A. Yes. We selected new options to meet
5 very high standards of environmental controls.

6 Q. And the other graph that is on that
7 page shows Case 26 with NUGs added to it. And the NUG
8 figures are taken from the same graph that we got the
9 CO(2) figures from two pages earlier, that's figure 4.1
10 of the environmental analysis.

11 And, again, if my addition is wrong, I
12 hope you will let me know, but in adding the NUG values
13 to Case 26, you have a situation for a few years near
14 the end of the plan where you are not meeting the
15 62-gigagram-per-year limit and an even longer period of
16 time where you would be above the 40-gigagram-per-year
17 limit.

18 MS. RYAN: A. Again, as with CO(2), it
19 is not appropriate to add the NUG emissions to Ontario
20 Hydro emissions and compare them to a hypothetical
21 Ontario Hydro standard. We have options to lower our
22 NOx emissions, and we would assume that if NOx
23 reduction targets are required, that the NUGs industry
24 would be regulated as well.

25 Q. I take that point, Ms. Ryan, and I

1 assume that is the Hydro position. But some
2 intervenors might suggest that the total emissions
3 resulting from the production of electricity should be
4 considered, in which case, a graph such as this might
5 be one way of looking at that.

6 A. And I agree it should be considered,
7 just not necessarily in the form that you are doing.

8 Q. And if we continue on. A graph on
9 page 10 is the same graph, only with respect to Case
10 15. And while Case 15 is below the protocol target of
11 62 gigagrams per year, even with NUGs added to it - and
12 I take your point about that - even Case 15 does not
13 meet the protocol target of 40, again subject to the
14 discussion we had earlier about whether it might or
15 might not occur.

16 A. Again, the Case 15 would not have
17 appropriate control technology built into our existing
18 units to meet a regulation which did not exist at that
19 time.

20 Q. So, just dealing with that point in
21 Case 15, you would, as we said earlier, either increase
22 your costs for those plants that would require this
23 further technology or you would, in effect, not run the
24 plants that would put you over this target if you found
25 yourself pushing the target of 40 gigagrams per year --

1 A. And it were regulatory limits, yes.

2 Q. Yes. And with respect to Case 26,
3 the situation is somewhat different though, is it not,
4 because you have already put SCR on all of your new
5 units, so that, at least -- well, perhaps we should
6 stop there. My understanding of Case 26 is that all of
7 the new units coming on line will have SCR associated
8 with them; is that correct?

9 MR. SNELSON: A. All the new base load
10 units, but not the peaking units.

11 Q. Right. So, if, in fact, Case 26 has
12 its base units with SCR already, that leaves you even
13 less room to manoeuvre with respect to NOx emissions,
14 does it not?

15 A. Yes.

16 Q. In fairness, I understand that Hydro
17 is also looking at new injection technologies with
18 respect to NOx emissions; is that correct?

19 MS. RYAN: A. Yes.

20 Q. SCRs are the process which will
21 reduce NOx the most, but where do new injection
22 technologies fit in? What sort of performance are you
23 hoping to get from those?

24 A. I believe around 30 per cent, but it
25 could be 30 to 50 per cent, depending on this specific

1 unit. There is a test plan to see what sort of
2 reduction could be obtained, but again, if you want to
3 get into detail of fossil control technology, Panel 8
4 would be better able to answer you.

5 Q. Okay. I will pursue that in Panel 8
6 then. I was going to ask you about the interaction of
7 the new injection technology with the limits that we
8 were discussing, 62 and 40.

9 Would you prefer that that question be
10 deferred to the specific panels?

11 A. I think that would be better, yes.

12 Q. We will deal with that then.

13 I would like to turn to the next page and
14 deal with - that's page 11 of Exhibit 145 - and deal
15 with scrubbers. That is a chart that we had prepared
16 from Hydro data that deals with efficiency, reliability
17 and effectiveness. And just so that we all understand
18 each other. As I understand it, efficiency is the
19 percentage of SOx removed when the scrubbers are
20 working properly; is that fair?

21 MR. TABOREK: A. Yes.

22 MS. RYAN: A. Mr. Taborek would be
23 better suited to answer this.

24 MR. TABOREK: A. Yes.

25 Q. And reliability is the percentage of

1 time that each scrubber train is working properly and,
2 in fairness, I believe Hydro has referred to that as
3 "availability"?

4 A. Yes.

5 Q. The overall scrubber effectiveness is
6 the percentage of SOx which is removed on average
7 taking into account both the times the scrubber is
8 working and the times it is not?

9 A. Yes.

10 Q. Mr. Taborek, could you help me out
11 with just a first order approximation? Can we get a
12 good idea of overall scrubber effectiveness by simply
13 adding up the differences from a hundred, with respect
14 to both the efficiency and the reliability? Does that
15 give us a good first-order approximation?

16 A. Well, multiplying the first two gives
17 the third.

18 Q. Multiplying the first two gives the
19 third?

20 A. Yes.

21 Q. At the present time in the Hydro
22 plan, do you expect to install any spare scrubber
23 capacity, either on the existing units or the new
24 units?

25 A. What is your definition of spare?

1 Q. For instance, if you had two scrubber
2 trains dealing with a pair of units at one of your
3 plants and they can deal with a hundred per cent of the
4 emissions. If one of them goes down, you are not going
5 to have anything in reserve. Is there any thought to,
6 perhaps, building three scrubbers, so that if one goes
7 down, you would still have two remaining?

8 A. No other options would fill that
9 purpose.

10 Q. But not a scrubber option.

11 A. Not a scrubber, no.

12 Q. What other options would fill that
13 purpose?

14 A. Generally lower sulphur fuels and an
15 energy margin.

16 Q. I didn't hear that.

17 A. An energy margin.

18 Q. Could you elaborate on that, please?

19 A. Just as we have mentioned there
20 should be a 24 per cent reserve margin for planning
21 capacity for reliability purposes, we plan with a 9
22 terawatthour energy margin. And that, plus the other
23 measures that we can take in place, aside from
24 scrubbers, are designed to cater to energy
25 contingencies.

1 MR. SNELSON: A. That was discussed in
2 Interrogatory 2.7.66.

3 Q. Thank you.

4 Just before we leave that energy margin,
5 if we could look at the reasons that that came about.
6 Was that actually implemented with scrubber train
7 inefficiency in mind, or was it more brought in because
8 of concern, shall we say, with respect to some of the
9 nuclear units or things like that?

10 MR. TABOREK: A. Like any margin, it is
11 to cover anything that can happen to you, and those
12 things can be things to the scrubber, things to the
13 nuclear load, water, whatever.

14 Q. What would be a more probable event
15 that this margin would deal with? A scrubber --

16 A. We haven't had any scrubbers, we have
17 no scrubbers yet, so up until now, it has been dealing
18 with load forecast uncertainties and nuclear production
19 uncertainties.

20 Q. And so, if you have a 9 terawatthour
21 energy margin when you have no scrubbers, if in fact
22 you are going to use part of that margin to account for
23 your scrubbers, you are going to have to increase that
24 energy margin. Is that fair?

25 Or do you decrease the margin?

1 A. No, no, not necessarily. We review
2 the margin from time to time, but it doesn't follow as
3 you suggest.

4 Q. Well, it would follow, then, that if
5 you brought scrubbers in, and if they used up part of
6 the margin, then there would be less of a margin --

7 A. They don't use up -- okay, they are
8 another contingency that the margin has to deal with.

9 Q. Yes.

10 MR. SNELSON: A. The base case on which
11 the margin is added has assumptions in it about
12 scrubber reliability and scrubber efficiency. So, the
13 margin doesn't have to cover the fundamental expected
14 amounts of unreliability and inefficiency from
15 scrubbers; it only has to consider the variability
16 about the expected scrubbers.

17 Q. So, in effect, scrubbers are in the
18 margin?

19 A. In deciding what is the expected
20 emissions in 1995, say, then the scrubbers in those
21 simulations are modelled as having a certain
22 reliability and a certain efficiency which leads to a
23 certain effectiveness. So, the expected imperfections
24 of the scrubbers are in the base case. And then we say
25 we want our scrubber program to be able to handle

1 coal-fired or fossil-fired energy production, which is
2 9 terawatthours higher than that.

3 So, the base projection has the expected
4 amount of imperfections of scrubbers built into it; the
5 margin is only covering the variability about the
6 expected amount of imperfections.

7 Q. And that variability includes
8 scrubbers, so it is already being considered?

9 A. The expected inefficiency, the
10 expected non-available times are incorporated in the
11 base before the margin is added.

12 Q. Maybe it's Monday and I am just a
13 little thick, Mr. Snelson. Perhaps I could just ask
14 you a question, and I will say, "Answer yes or no," but
15 you, of course, know that you don't have to answer yes
16 or no, you can elaborate as much as you want.

17 But could you just tell me, yes or no,
18 whether the scrubbers are in this energy reserve?
19
20
21
22
23
24
25

...

1 [12:20 p.m.] A. The scrubbers are one of the measures
2 of meeting acid gas control, and that is to meet both
3 the expected amount of fossil emissions and the
4 allowance for additional energy, if required.

5 So, the scrubbers here are both part of
6 the problem and part of the solution. They are much
7 more part of the solution than they are part of the
8 problem. If I install scrubbers, the situation gets
9 better.

10 Q. Right.

11 DR. CONNELL: Mr. Watson, if it wouldn't
12 be diverting you, could I just ask, is it important, in
13 your judgment, that the panel understand all the
14 entries in this table?

15 MR. WATSON: We are going to get to that,
16 Dr. Connell, and I would suggest to you, yes.

17 DR. CONNELL: Yes.

18 MR. WATSON: The very simple answer to
19 that question is, as the scrubber effectiveness
20 changes, the amount of emissions changes as well, and
21 that has a direct impact on any fossil option.

22 DR. CONNELL: Yes. Just as a general
23 comment, it might have been easier or more accessible
24 if it had had a caption on it and perhaps a little more
25 detail in the legend.

1 MR. WATSON: Okay, I will keep that in
2 mind for my future graphs. Thank you.

3 Q. Well, in any event, we will move on.

4 If a scrubber module fails, I understand
5 that you can either keep running and emit more SOx and,
6 in effect, operating in a bypass mode, or you can
7 derate or shutdown the unit; is that fair?

8 MR. TABOREK: A. I think you would not
9 derate; you would shut down. Yes.

10 Q. So, you either bypass and keep
11 running or you --

12 A. And presuming the regulation would
13 either permit bypass or not.

14 Q. Oh, yes.

15 A. There is no derating involved in
16 that.

17 Q. What is your current assumption on
18 out-of-service scrubber modules? Are you assuming that
19 you will bypass and work within the limits?

20 A. Yes, we would bypass.

21 Q. So, that means, on average, the
22 fraction of SOx that is removed by the scrubbers will
23 be equal to what we have called overall scrubber
24 effectiveness?

25 A. Yes.

1 Q. Now, could you tell me what overall
2 scrubber effectiveness was assumed in the environmental
3 analysis?

4 A. Which environmental analysis now?

5 Q. The environmental analysis which
6 accompanied the Balance of Power.

7 MR. SNELSON: A. The amount of SO(2)
8 emissions that were reported in the environmental
9 analysis were provided from the system simulations that
10 are described in the Demand/Supply Plan Report, Exhibit
11 3, and transferred over. So, the assumptions are those
12 that are in the system simulation that were done for
13 Plan 15 in the Plan Report, Exhibit 3.

14 Q. Okay. Could you tell me what that
15 effectiveness is?

16 A. It would be in the LMSTM data, and
17 Mr. Taborek may be familiar with what it is, but I
18 haven't got the figure at my fingertips.

19 Q. Mr. Taborek, could you go through
20 that big black manual of LMSTM and get me that answer?

21 A. We will have to take an undertaking.

22 Q. That would be 146.37.

23 THE CHAIRMAN: 142.37, isn't it?

24 MR. WATSON: 142.37, yes. Thank you, Mr.
25 Chairman.

1 ---Off the record discussion.

2 MR. WATSON: Q. Are you assuming that
3 the scrubbers you put on the new units will be the same
4 as the ones put on the existing units?

5 MR. TABOREK: A. Again, that will be
6 something I will check.

7 Q. 142.38.

8 If you refer to the chart that I have put
9 in front of you, on page 11, the first line says
10 Thermal Cost Review, and the figures for efficiency,
11 reliability and effectiveness were taken from that
12 figure. Sorry, let me clarify that. The figures for
13 efficiency and reliability were taken from that review.

14 As you said, Mr. Taborek, the
15 effectiveness is obtained by multiplying the efficiency
16 by the reliability. The thermal cost review in Table
17 ES5 mentions a 90 per cent figure, as opposed to the 93
18 which would result when you multiply the efficiency by
19 the reliability. Is this, in effect, a planning
20 conservatism which is built in?

21 A. No, it's a different type of
22 scrubber. The first line refers to a limestone dual
23 alkali type of scrubber, the remaining four lines refer
24 to limestone slurry scrubbers. A different reagent is
25 used to remove the SO(2)

1 Q. And as a result, is the slurry
2 necessarily somewhat less effective than the dual
3 alkali?

4 A. Yes. If you would like to fill in
5 the blanks on that line, the reliability is the same,
6 about 95 per cent, the efficiency is 95 per cent.

7 Q. In the Acid Gas Control Reference
8 Plan, you have indicated that you have reduced assumed
9 scrubber reliability from 95 per cent to 90 per cent.
10 That was for 1989.

11 When we reviewed 1990 Acid Gas Control
12 Reference Plan we didn't see anything in that. Is it
13 fair for us to assume that you have stayed with the
14 same value of reliability, 90 per cent for 1990?

15 A. I will take an undertaking.

16 Q. That's 142.39.

17 Mr. Taborek, you have helped us out a lot
18 by telling us that there is a difference between the
19 scrubber numbers that are here. What sort of scrubber
20 is going to be on Lambton, for instance?

21 A. The limestone slurry.

22 Q. And what sort of scrubber is proposed
23 for the future units?

24 A. Nanticoke has not yet been decided;
25 there is some consideration being given to the

1 limestone dual alkali; however, it may be the limestone
2 slurry.

3 Q. What about new units that are built,
4 has a decision been made?

5 A. I think we just described them in
6 terms of their performance rather than their technical
7 characteristics.

8 Q. So, a decision hasn't been made on
9 which technology to use for the new units?

10 A. That's correct.

11 MR. SNELSON: A. There is probably an
12 assumption in the thermal cost review but that would be
13 something you would discuss with Panel 8.

14 Q. Yes, I believe the assumption is that
15 there would be a slurry used. I'm sorry, I am
16 corrected. The assumption apparently is that they
17 would be dual alkali, but we will discuss that with
18 Panel 8.

19 I was going to get into a discussion,
20 more indepth discussion, about the actual efficiency of
21 scrubbers and their reliability. Is that something
22 that you people can deal with, or do you feel that the
23 Panel 8 is more appropriate?

24 MR. TABOREK: A. Depending on how
25 detailed, I can give you the general assumptions we use

1 about scrubber efficiency and reliability, and if you
2 wish to go further, then, perhaps, I would refer to you
3 Panel 8.

4 Q. Perhaps we could proceed along that
5 basis.

6 Dealing first with efficiency, could you
7 go through those basic assumptions?

8 A. Generally, there are three key
9 assumptions. One is what is guaranteed, and then
10 secondly, what might be expected for the limestone
11 slurry and the limestone dual alkali.

12 Now, the efficiency specification for the
13 limestone slurry is typically 90 per cent. The
14 specification we would expect for the dual alkali is 95
15 per cent. It is recognized to be a more efficient
16 scrubber.

17 In the case of the limestone slurry
18 scrubber again, the expected performance is more in the
19 nature of 95 per cent, but not guaranteed.

20 Q. Okay. when you say "performance" --

21 A. Efficiency.

22 Q. You are talking efficiency?

23 A. I am speaking strictly efficiency
24 through this part.

25 Q. Okay.

1 A. And again, the expected performance
2 of the dual alkali will be 98 per cent.

3 So, that's the respective efficiency of
4 those scrubbers.

5 Q. Could we now turn to reliability and
6 if you could go through the same exercise, please?

7 A. In reliability, in both cases we
8 expect approximately 95 per cent. There is some
9 history from the United States that well-designed
10 scrubbers are doing much better than 95 per cent, and
11 there is more experience with the limestone slurry than
12 there is with the limestone dual alkali, so it's a
13 firmer number.

14 Q. So, that 95 per cent figure is 95
15 across the board for dual and slurry, guaranteed and
16 expected?

17 A. Yes.

18 Q. If I could, then, just refer you to
19 the Acid Gas Control Reference Plan. Why in January
20 1989 did that plan reduce the reliability from 95 per
21 cent to 90 per cent?

22 A. It was basically comparing the
23 coincidence of outages of the scrubber and the thermal
24 plant that led us to make a reduction of 5 per cent.

25 Q. Was that looking at historic data?

1 Is that a one-time reduction?

2 A. No, it was basically the size of the
3 outage rates that we were looking at that have since
4 been modified that led to us make an additional factor,
5 or an additional adjustment.

6 Q. Thank you.

7 Now, I am a little at sea about that last
8 answer. I am not sure I really understand what you are
9 trying to convey to me. Could you try again, if you
10 wouldn't mind?

11 A. Perhaps I will take an undertaking
12 then. If I am confusing you, perhaps I am confused
13 myself, and I will get an undertaking.

14

15

16

17

18

19

20

21

22

23

24

...

25

1 [12:35 p.m.] Q. I certainly have no difficulty with
2 you taking an undertaking, Mr. Taborek, but just as a
3 general rule, you should not assume that because I do
4 not understand it, you are confused.

5 A. Well, you will notice I paused a fair
6 bit, so...

7 MRS. FORMUSA: Is that 142 point...?

8 MR. WATSON: 142.40.

9 Q. Well, Mr. Taborek, if we could look
10 at the '89 forecast of reliability indices, dealing
11 with the reliability, we obtained a figure of 82 per
12 cent by, in effect, taking a forced outage rate of 8
13 per cent and a planned or maintenance outage rate of 10
14 per cent. First of all, is that a fair way of looking
15 at the reliability?

16 MR. TABOREK: A. For the scrubber
17 itself, and assuming no bypass. But, it does not
18 consider the fact that some of the outages would be
19 coincident.

20 MR. SNELSON: A. It also doesn't take
21 into account that some of the planned maintenance can
22 be arranged at times when you didn't want to run the
23 unit anyway.

24 Q. Just so I understand, was that what
25 Mr. Taborek was talking about when he was talking about

1 coincidence?

2 A. No. I think there are two elements.

3 Q. Because that appears to be
4 coincident. I mean, if you can arrange the two so they
5 work together, that would seem to be optimum.

6 A. There is coincidence because the
7 planned outage for the generating facilities maybe can
8 be lined up with the planned outage for the scrubber,
9 so as they overlap, you do not have to count both.

10 There are also times when you may not
11 need to run that generating unit on the system, because
12 there just isn't enough load. And you would attempt to
13 do both scrubber planned maintenance and generating
14 planned maintenance, whether or not they overlap,
15 during the periods when you do not need to run the
16 unit.

17 Q. We looked through the forecast for
18 reliability indices and these were the only figures we
19 could find. Is there some other indication of scrubber
20 reliability in the forecast, other than what we have
21 mentioned here?

22 MR. TABOREK: A. No.

23 Q. Based on the qualifications that you
24 have just made, is there any way we can go from this 82
25 figure to a figure that would be more realistic, in

1 your mind?

2 A. Well, one step would be to use the
3 1990 reliability indices.

4 Q. Is there anything in there?

5 A. Yes. There are the same numbers,
6 combined slightly differently.

7 The '89 values were basically produced by
8 Hydro forecasting, and the '90 values were produced as
9 a result of having called tenders and gotten improved
10 information. And the information, basically the total
11 incapability is reduced from about 18 per cent in the
12 '89 reliability indices report to about 12 per cent
13 with --

14 Q. And are you reading --

15 A. I'm sorry.

16 Q. Sorry to interrupt you, Mr. Taborek.
17 I just wanted to clarify where you were. You were
18 reading from page 3 of the explanatory notes of the
19 1990?

20 A. Yes. Generally, it is there, yes. I
21 have extracted some of that information on your sheet
22 here.

23 Q. I have it on page 3 under Item 1.3.5
24 at the last paragraph under the 1990 forecast of
25 reliability indices.

1 MR. SNELSON: A. When you say "1990," is
2 that the January 1990 issue?

3 Q. That is April 1991, the Report SP688.
4 That is what you were referring to, was it not, Mr.
5 Taborek?

6 MR. TABOREK: A. Yes. And on page 3,
7 the third paragraph, you will notice --

8 THE CHAIRMAN: I am sorry. Page what?

9 MR. TABOREK: Page 3.

10 THE CHAIRMAN: Thank you.

11 MR. TABOREK: Third paragraph, the impact
12 of scrubber operations without bypass is estimated at
13 7.5 per cent for DAUFOP and MOF and 5 per cent for POF,
14 so those are our most recent forecast.

15 MR. WATSON: Q. As you indicated, in the
16 1989 forecast, the figures were 8 per cent and 10 per
17 cent, giving a value of 82 per cent for reliability.

18 You have indicated that in '90, they have
19 changed to 7.5 and 5 per cent, giving a value of
20 12-and-a-half per cent, which would change the 82
21 figure to 87.5; is that fair?

22 MR. TABOREK: A. Yes, yes.

23 Q. How do you --

24 A. And then you would have to allow for
25 coincidence in outages.

1 Q. Okay. And you said the first step
2 was to go to the more recent figures, which we have
3 done. The second step is to allow for coincidence.
4 Can you tell us how we would do that?

5 A. I think we have basically made some
6 estimates that we would be looking at very small,
7 perhaps negligible, outages as a result of the scrubber
8 operation, perhaps negligible, perhaps as high as 5 per
9 cent, but in that band. As a result, the recent
10 experience with good, well-designed scrubbers has been
11 of that nature.

12 Q. We are talking about coincidence here
13 and you are giving us some other figures. Does bypass
14 also play a role in those figures?

15 A. In that instance, the excellent
16 reliability is with bypass.

17 Q. So, if there was no bypass, that
18 would affect those figures?

19 A. Yes.

20 Q. The figures that you were dealing
21 with earlier, when you were talking about reliability,
22 you said 95 across the board for dual, slurry, with
23 both guaranteed and expected values. Does bypass have
24 an impact on those values?

25 A. Those are with bypass.

1 Q. With bypass. So, Mr. Taborek, if you
2 are looking at the overall effectiveness, then we
3 really cannot use the 95 per cent reliability figure,
4 can we? We have to use a different figure to account
5 for the bypass.

6 A. Well, you are assuming a regulation
7 that does not permit bypass?

8 Q. Well, if, in fact, you wanted to
9 operate without bypass, yes.

10 A. Yes. If you were doing that, you
11 would.

12 Q. And the reason you would want to do
13 that is so that you could have a handle on what total
14 emission were?

15 A. Well, you always have the knowledge
16 of what your emissions are. At present, you calculate
17 them from the sulphur content of the coal, and in
18 future, they will be monitored as they are emitted.

19 Q. Well, just before I leave this issue,
20 the issue of bypass is significant because, as I
21 understand it, dealing with the plan and dealing with
22 the future units, you are putting scrubbers on, and in
23 the future units, are you assuming bypass or are you
24 assuming no bypass?

25 A. We are assuming that we will bypass.

1 Q. You will bypass?

2 A. Yes. What our regulation; PURPA,
3 that now governs us is the total tonnes emitted over
4 the course of a year by the system.

5 The prohibition of bypass is, in effect,
6 putting a new regulation on us through the mechanism of
7 the certificates given for the equipment and as a
8 result - this is one of the examples I mentioned to
9 you -- that regulations change fairly frequently and
10 they can change the characteristics of your system, as
11 a result.

12 MS. RYAN: A. Could I just add that, in
13 addition to the emission cap that Mr. Taborek
14 mentioned, there is still the modelling requirement
15 that the design of the station would be required to
16 meet specific impingement concentrations, even on
17 bypass, so that limit would still have to be met.

18 Q. Mr. Taborek, if we are in an exercise
19 where we are going to forecast what the emissions are
20 going to be, you need to know what is happening with
21 the scrubbers; is that fair?

22 MR. TABOREK: A. Yes.

23 Q. And is it also fair to say that in
24 dealing with that issue, the figure to look at is the
25 figure that you quoted of 7.5 for DAUFOP, MOF and 5 per

1 cent for POFs?

2 Q. No. I would recommend a scrubber
3 efficiency of 95 per cent. A scrubber reliability of
4 95 per cent and a scrubber effectiveness of 90 per
5 cent, which assumes bypass, as well.

6 Q. Thank you. In the course of your
7 evidence, when you were talking about the efficiency,
8 you mentioned the slurry had a guaranteed efficiency of
9 90 per cent and an expected efficiency of 95 per cent?

10 A. Yes.

11 Q. If, in fact, we use the 90 per cent
12 guaranteed value for efficiency and the 95 per cent for
13 reliability, that is going to give us a value somewhere
14 below 90 per cent for effectiveness, probably around 86
15 per cent, something like that, 85 per cent; is that
16 fair?

17 A. Yes.

18 Q. And correspondingly, any further
19 decrease in efficiency below 95 per cent or below the
20 90 per cent that you spoke of for guaranteed, or below
21 95 per cent for reliability, is correspondingly going
22 to decrease the overall effectiveness of the scrubbers;
23 is that correct?

24 A. Yes.

25 Q. And just so we get an idea of the

1 difference in percentage, if we went from a 90 per cent
2 overall removal rate to an 85 per cent overall emission
3 removal rate, that would increase the overall SOx
4 emissions by 50 per cent, would it not?

5 A. That is correct.

6 MR. SNELSON: A. From the scrubbed
7 plants; not necessarily from the system.

8 Q. Yes, correct. Certainly, I am
9 dealing with the plants here with scrubbers on them.

10 MR. TABOREK: A. Yes.

11 Q. So, a reduction from 90 to 85
12 increases the emissions by 50 per cent, and,
13 correspondingly, if you went from 90 per cent to 80
14 per cent, the emissions would double?

15 A. Yes. Again, we are talking about
16 forecasts which can err on one side. The experience
17 with scrubbers recently has been improving, as more and
18 more are built, and more and more experience is
19 obtained with them. And there is work going on about
20 additives and other measures for improving the
21 efficiency of scrubbers and the same arithmetic, the
22 same leverage, if you will, applies on the upside as
23 the downside.

24
25 ...

1 [12:50 p.m.] And so recognizing the concerns on the
2 downside and recognizing potential on the upside, the
3 95/95 is a good set of numbers to use at the present.

4 Q. I suppose just following up on that,
5 we have been dealing with Case 26 somewhat. If, in
6 fact, you increased the SOx emissions by 50 per cent or
7 doubled them, if your effectiveness was down to 80 per
8 cent, that would put you significantly over the limit
9 that was set for total acid gas emissions, would it
10 not?

11 A. Yes. With the caveat, of course,
12 that there is a law to be obeyed. If we found out that
13 we were not in a position to obey the law, then we
14 would take strong measures to ensure that we did.

15 Q. Yes. And we have talked about those
16 measures before and I won't talk about them again.

17 Also, when you are talking about those
18 measures, you are talking about not only a short-term
19 measure, but you are talking about long-term measures
20 as well, aren't you?

21 A. Appropriate to the problem you were
22 experiencing, yes. Whatever you had diagnosed the
23 problem that was giving you your reduced performance,
24 you would take appropriate steps to solve it.

25 Q. A couple of quick questions. If you

1 could turn to page 12 of Exhibit 145, which is page 51
2 of the State of the Environment Report 1989, a quarter
3 of way down the page, there is a mark and the sentence
4 reads:

5 "Results of a joint Canadian
6 Electrical Association-Environment Canada
7 project found that reported NOx emissions
8 (based on optimum boiler conditions) are
9 lower than measured emissions (based on
10 as-found boiler conditions) by up to 30
11 per cent in some cases."

12 As I have read that, that would seem to
13 imply that Hydro currently believes that your NOx
14 emissions are higher than what they used to be. Is
15 that a fair reading of that?

16 MS. RYAN: A. Not really. They are
17 fairly close to what we had thought they were before,
18 because there were some conservative assumptions in the
19 way we used to calculate emissions. And based on the
20 study, it was right across Canada, so it wasn't just
21 our boilers, it was a general statement.

22 Q. Well, Ms. Ryan, I am not trying to
23 trap you. I have got a couple of statements here that
24 I don't understand and they seem to indicate different
25 things.

1 If you can turn to the next page, which
2 is page 13, which is the Response to Interrogatory
3 2.17.13.

4 A. Yes.

5 Q. Again, the part that is marked on the
6 side. That seems to imply that calculations of NOx
7 emissions which were used prior to recent testing were
8 conservative. And when I read that, it seemed to
9 indicate to me that the NOx estimates were lower than
10 what you used to believe.

11 When I read the two statements together,
12 I got different understandings or different meanings,
13 and I was just wondering if you can clear that up for
14 me.

15 A. On page 51, the Canadian Electrical
16 Association tests found values up to 30 per cent higher
17 than we had measured in tests when they just walked
18 into a boiler and measured it.

19 Q. So, their test found that there was
20 more there than you had thought?

21 A. For some units at some times, yes.

22 Q. Okay, great.

23 So, can we move to the next one then.

24 A. Yes.

25 Q. That seemed to me to imply that you

1 had less than you thought, less NOx than you thought?

2 A. There are two aspects to the problem.
3 One is the way you measure it and the other is the way
4 you calculate it. And we had conservative assumptions
5 for calculating it which compensated for the error in
6 measurement, so we ended up in about the same place.

7 Q. Were there any studies done to deal
8 with that, to review that assumption that you are high
9 one way, low the other way, and it all works out?

10 A. In fact, there were a series of tests
11 carried out to do measurements on each unit and
12 incorporate it into our calculation method, and that
13 was approved by the Ministry of the Environment as the
14 way in which we calculate and report our NOx emissions.

15 Q. Okay.

16 So, those aren't contradictory, they deal
17 with different things, measurement versus calculation?

18 A. The first one is--

19 Q. Is measurement?

20 A. --is measurement, yes.

21 Q. And the second one deals with
22 calculation, so that's the explanation?

23 A. Yes, because the assumption on the
24 section page is the way it was calculated, which was
25 conservative, so the first one is the first page you

1 referred to, page 51, is a measurement and the second
2 one is the assumption in the calculation, which was
3 conservative.

4 Q. They, in effect, offset?

5 A. To a large extent.

6 Q. Is this a function of load?

7 A. Yes. The way we used to calculate
8 NOx emissions assumed that all of our megawatts was at
9 full load which is a conservative assumption because
10 NOx reductions are at higher loads. The way we do it
11 now is have an algorithm that calculates it based on
12 the actual load and what NOx would have been at that
13 load.

14 Q. So, if you are varying your load, how
15 does that affect the trade-off that you have?

16 A. If you are varying your load, your
17 NOx emission rate is varying with load, it's lower at
18 low load and higher at high loads.

19 Q. And in dealing with this measurement
20 versus calculation trade-off, how is that sensitive to
21 load? Does it always come out in the middle
22 regardless?

23 A. We have changed our method of
24 calculation so that we now base it on megawatts, which
25 we have hourly megawatts for each unit, and we have NOx

1 tests at various loads for each unit and it's an
2 algorithm that calculates NOx. It is a more accurate
3 calculation now over the last two years, a year.

4 Q. One question, before we leave this
5 area.

6 Is it fair to say, then, based on what
7 you are saying about the new calculations, that for a
8 base load unit, the calculation is going to result in a
9 higher value?

10 A. Our fossil stations aren't base load.

11 Q. Okay. If a fossil was run at base --

12 A. For that assumption, yes.

13 Q. Thank you.

14 I am about to turn to another sub-area,
15 Mr. Chairman, but I am very close to finishing the
16 environmental area.

17 THE CHAIRMAN: Perhaps we should stop and
18 come back at two-thirty.

19 THE REGISTRAR: This hearing will adjourn
20 until two-thirty.

21 ---Recess at 1:00 p.m.

22
23
24
25 ...

1 ---On commencing at 2:32 p.m.

2 THE REGISTRAR: Please come to order.

3 This hearing is now resumed. Come to order.

4 MR. WATSON: Q. Panel, we were talking
5 about scrubbers. If I could leave that now and move to
6 particulates. I have a few brief questions.

7 In reading the DSP and some of the
8 comments from the government on the DSP, I noticed a
9 figure of 98 per cent dealing with the removal of
10 particulates from fossil-fired units. Can you give me
11 any indication of whether there is any current limit or
12 target for particulate removal at Hydro?

13 You are looking puzzled, Ms. Ryan. I can
14 give you the reference. It's page 14-19 of the plan,
15 and it reads, Hydro has also installed emission control
16 devices between the furnace and the stack, which
17 typically remove over 98 per cent of the particulates?

18 MS. RYAN: A. The legal requirement for
19 particulate would be under the Environmental Protection
20 Act, and, again, is based on the ash content of the
21 fuel, and precipitator efficiency, and is a modelled
22 value to meet an impingement standard.

23 Q. Could you tell me where I would find
24 that standard?

25 A. In the Environmental Protection Act.

1 Q. It's all set out there?

2 A. The value for groundlevel impingement
3 would be, yes.

4 Q. Are there any other documents that
5 you could refer me to, to assist me with this concept
6 of particulate removal?

7 A. Not at this time, no.

8 Q. I understand in the United States,
9 some of the jurisdictions have a 99 per cent minimum
10 for the removal of particulates. Has Hydro
11 investigated any further standards, further targets and
12 whether they should be striving for something greater
13 than 98 per cent figure?

14 A. One of the other limits would be the
15 opacity which I referred to in my direct evidence and
16 the amount of visible emission.

17 MR. SNELSON: A. The details about the
18 precipitator efficiency that can be achieved are
19 probably best addressed by Panel 8 in terms of what
20 technology can achieve.

21 Q. I have looked at Interrogatory 2.2.8,
22 which provides documentation relating to emissions and
23 discharges from the natural environment. In
24 particular, sulphur dioxide, nitric oxide, total acid
25 gas and particulates. Is there any other source of

1 information besides this document, and is this the most
2 up-to-date document which would give me those figures?

3 MS. RYAN: A. Of actual particulate
4 emissions from our stations?

5 Q. Yes.

6 A. That is the current information and
7 it would be based on precipitator testing for any given
8 station.

9 Q. Can you tell me what emission rates
10 were assumed for the new units to be built for
11 particulates?

12 A. No, I'm sorry, I can't.

13 MR. SNELSON: A. I am just looking at
14 your next sheet, which I thought had it on it. I
15 expect that the solid wastes column is ash and not
16 particulate.

17 Q. Just following up on that. I have
18 understood that there was a difference between solid
19 waste as a by-product from producing electricity and
20 particulates; is that correct?

21 A. The particulates that are emitted are
22 the ones that go up the stack that you don't collect.
23 The fly ash, which becomes part the solid waste, are
24 the ones that you do collect.

25 Q. Yes. And when we are globally

1 talking about the area of particulates, those are the
2 things that go up the stack and that is what we are
3 having our discussion about; was it?

4 MS. RYAN: A. Yes, particulate
5 emissions, the ones that actually go out.

6 Q. You were talking opacity
7 considerations. How are the limitations which have
8 taken place, with respect to the output of Lakeview,
9 Nanticoke, and Lambton, for opacity, related to
10 particulate emissions?

11 A. There isn't really a one-to-one
12 correlation between opacity and particulate emissions.
13 Obviously, the more opacity that you can see, the
14 higher the particulate emissions. But it depends on
15 the specific size characteristics of the particulate,
16 so you would have to do physical tests on a given unit
17 to find the relationship. And I don't believe, at this
18 point, we have those.

19 I know there have been studies done to do
20 a correlation, but I don't have that information.
21 Again, Panel 8 would have more information on
22 precipitator characteristics.

23 Q. Can you tell me if there are any new
24 particulate limitations being considered?

25 A. In Ontario, they were looking at a

1 more stringent opacity limit, in that it would be a 20
2 per cent limit all the time and not a small amount of
3 time allowed at 40 per cent.

4 Q. Which is the current standard?

5 A. Which is the current standard.

6 Q. Anything else?

7 A. Not to my knowledge.

8 Q. If I could turn to toxic chemicals.

9 I understand that heavy metal emissions are associated
10 with coal combustion; is that correct?

11 A. Yes.

12 Q. And they are not currently dealt
13 with; is that also correct?

14 A. Not entirely. Specific heavy metals
15 are again regulated through the design of the station
16 and the calculation of an impingement concentration.
17 We do not have an emission cap for heavy metals the
18 same as we do for acid gas.

19 Q. But what you are saying is you would
20 recognize that the burning of coal or other fossil
21 fuels might release some of these and as a result you
22 design your plant to take care of those particular
23 emissions?

24 A. The design of the plant up until
25 this -- some of them are removed with the particulate

1 matter in the precipator, so that is correct. But the
2 calculation I was talking about was calculating the
3 result of an emission at stack height and what the
4 concentration would be when it reached ground level.
5 And that is regulated for some heavy metals, and yes,
6 our stations would meet those.

7 As a matter of fact, Interrogatory
8 2.14.70, which was the Lakeview test you referred to,
9 the table that you selected some of the information
10 from, in fact, had all of the heavy metals that were
11 tested for and listed there and their per cent of the
12 impingement standard was calculated, and I believe most
13 of them were under one per cent of existing regulation.

14 Q. We were talking about heavy metals,
15 would 2.14.70 also deal with toxic organics and VOCs?

16 A. It measured organics, yes. Volatile
17 organic compounds for Ontario Hydro are not generally a
18 problem, but we measure them when we do our
19 characterization studies.

20 Q. What do you mean, they are generally
21 not a problem?

22 A. Well, the industries that are being
23 looked at for volatile organic compound emissions are
24 the petroleum industries, paint industries, solvents,
25 because their emissions are considerably higher.

1 So, in talking NOx/VOC plan, NOx is the
2 area we are concerned with. When it's VOC, they are
3 talking different industrial sectors.

4 Q. Can you tell me if, currently, there
5 are any further limits being considered for heavy
6 metals, toxic organics, VOCs, and how these limits, if
7 any, would affect Hydro's energy production in the
8 future?

9 A. Yes, the Ministry of the Environment
10 has issued a draft Clean Air Program which is a
11 revision to Regulation 308 of the Environmental
12 Protection Act, which in fact is looking at prevention
13 at the source, and they have defined three different
14 levels of concern for emissions and have identified
15 specific heavy metals and organics which they would set
16 emission limits for.

17 Again, it's a draft regulation. Industry
18 has now provided comment and we haven't heard back
19 whether or how that regulation is going to be changed,
20 but some of the emission limits being proposed would be
21 difficult for our existing fossil stations to meet.

22 Q. And all of that information is in the
23 revision to Regulation 308 under the EPA?

24 A. It is called the Clean Air Program.

25 Q. You indicated Hydro might have

1 difficulty meeting certain of the limits, could you
2 tell us which of the ones, currently, you might have
3 difficulty with?

4 A. Several of the proposed heavy metals
5 were manganese and mercury, and they were given a very
6 small annual limit. They would be two of the limiting
7 ones.

8 Q. And what effect would that have on
9 your existing fossil plants?

10 A. If in fact we had to meet it and
11 there were no control technology available to put in,
12 it would mean curtailing generation.

13 Q. Is there, currently, controlled
14 technology available?

15 A. I think the answer is we don't yet
16 know how the scrubbers that we are putting in for
17 sulphur dioxide might, in fact, affect the emissions of
18 heavy metals, and we are hopeful that it will remove
19 some of them. And certainly particulate control
20 technology may remove some of the trace emissions, as
21 well.

22 Q. Outside of that, do we have any
23 particular technology that's focused in on heavy
24 metals?

25 A. Not to my knowledge. But again, more

1 detail on fossil control technology could better be
2 covered by Panel 8.

3 Q. Okay. If I can turn now to the
4 Quebec City/Windsor corridor. During Environment
5 Canada's review of the DSP, and an excerpt from that is
6 at page 14 of Exhibit 145, approximately 40 per cent
7 the way down the page, they mention the potential for
8 more restrictive limits in this heavily-settled
9 corridor. The limits mentioned for NOx are 100
10 nanograms per joule for coal; 90 nanograms per joule
11 for oil, and 30 nanograms per joule for gas, to be
12 effective by 1995, for new sources; and by 1997, for
13 retrofitting of existing units.

14 And also, what it is mentioned earlier in
15 the paragraph is VOCs. I didn't find any reference to
16 VOCs when I looked through that. Is there one or did I
17 just miss it?

18 A. In this total report?

19 Q. Yes. I just wondered if you were
20 aware of a limit for them, because I didn't find one.

21 A. Could you tell me again what specific
22 report this came from?

23 Q. This was Environment Canada's
24 comments on the DSP. It doesn't have to be in here. I
25 am just wondering if you are aware of something.

1 [2:50 p.m.] MR. WATSON: It is the provincial
2 government review of the DSP, but at the back of it, I
3 believe, Environment Canada has made their comments, as
4 well.

5 THE CHAIRMAN: I cannot remember whether
6 the government review is or is not an exhibit yet. Do
7 you know? If it is not an exhibit, it probably should
8 be, so perhaps we can -- we don't need to stop now and
9 find that out, but if it isn't, we will put it in as an
10 exhibit.

11 MRS. FORMUSA: I don't believe it is.

12 THE CHAIRMAN: I do not recall it being
13 put in. I am sure it will be referred to at other
14 times and it probably should be marked.

15 MR. WATSON: Okay.

16 THE CHAIRMAN: What part of the
17 government review was it? Do you remember what exhibit
18 it comes from?

19 MR. WATSON: If you are looking at the
20 government review, the book I have, anyway, is a Cerlox
21 binder.

22 THE CHAIRMAN: It's page 2, though.

23 MR. WATSON: This is page 2 of the
24 Environment Canada section of that, which is at the end
25 of the review put forward by all of the various

1 government ministries.

2 THE CHAIRMAN: All right, okay.

3 MR. WATSON: My copy, anyway, has a blue
4 cover.

5 THE CHAIRMAN: Right.

6 MRS. FORMUSA: Should we make that an
7 exhibit now?

8 MS. PATTERSON: Should we give it an
9 exhibit number now?

10 THE CHAIRMAN: All right. We will give
11 it a number now and then it will be done. What number
12 is it?

13 THE REGISTRAR: 146, Mr. Chairman,

14 THE CHAIRMAN: Thank you.

15 ---EXHIBIT NO. 146: Review under the Environmental
16 Assessment Act.

17 MR. WATSON: Q. Ms. Ryan, you will
18 recall earlier, when we were talking about emissions,
19 we referred to the State of the Environment Report,
20 page 10, where we were talking about the emission
21 standards of 258 nanograms per joule for NOx for coal,
22 and 129 nanograms per joule as NOx for oil. And you
23 recall that we were saying that Nanticoke and Lakeview
24 now exceed the limit for both coal and oil. And in
25 trying to compare that to the 100 nanograms per joule,

1 obviously, the 258 is considerably higher.

2 One of the efforts that would be made to
3 try and control NOx, as I understand it, is low NOx
4 burners; is that correct?

5 MS. RYAN: A. Low NOx burners are one
6 way of reducing NOx, yes.

7 Q. And subject to your checking, I am
8 advised that 100 nanograms per joule for a 35 per cent
9 efficient plant translates to approximately 1 gram per
10 kilowatthour of emissions. Again, subject to check,
11 and please advise me if your calculations produce a
12 different figure.

13 In looking at page 15, the last page of
14 Exhibit 145, there are environment performance figures
15 from the thermal cost review, figure ES5, for Option
16 No. 2, which is a 4 by 500 megawatt U.S. coal unit,
17 shows that NOx emissions with no scrubbers and no SCRs
18 would be in the range of 1.2 to 1.5. Is that with or
19 without low NOx burners, the Option No. 2?

20 MR. SNELSON: A. This is for new
21 options, and it is presumed that new coal-fired plant
22 would be designed from day one for low NOx and SO(2)
23 emissions.

24 I do not think it is particularly
25 relevant to the existing plant, where the control of

1 NOx in the combustion process in the design of the
2 plant would be quite different perhaps to what a new
3 option would be.

4 Q. Okay. So, in looking at those same
5 figures, we can assume that there would be a low NOx
6 burner for the first set of figures, 1.2 to 1.5.

7 The second set of figures 1.3 to 1.6;
8 that is with a scrubber, but no SCR, and to get below
9 the level 1 gram per kilowatthour, which is as I have
10 been advised, what the hundred nanograms per joule
11 translates to, you, in effect, would have to have a
12 unit with scrubbers and SCRs, and low NOx burners alone
13 would not be sufficient to meet this limit?

14 MS. RYAN: A. Yes. For our units to
15 reach 100 nanograms per joule heat input would require
16 SCR.

17 Q. And the last issue I would like to
18 deal with, very briefly, is solid wastes.

19 In talking about Case 26, or any sort of
20 life extension, we have been talking about the use of
21 scrubbers. And I understand that it is fair to say
22 that scrubbers produce a large volume of solid waste;
23 is that correct?

24 A. Yes.

25 Q. And therefore, the use of Case 26 or

1 large-scale life extension is going to increase that
2 quite substantially?

3 A. I think it is fair to say it should
4 be considered a by-product because both the ash and the
5 gypsum can have uses, so to consider it a waste is not
6 exploring the utilization opportunities.

7 Q. Okay.

8 Mr. Chairman, I would like to turn to a
9 new area, that of plant performance. And Mr. Lucas has
10 another document for you in the same form with a
11 document precis on the front of a series of excerpts
12 including several tables.

13 THE REGISTRAR: That will be No. 147, Mr.
14 Chairman.

15 THE CHAIRMAN: Thank you.

16 ---EXHIBIT NO. 147: Plant performance reference
17 material to be used.

18 MR. WATSON: And again, Mr. Chairman, in
19 particular in this section, as a result of my meeting
20 with Hydro counsel on Friday, many of these questions
21 have been deferred to another panel.

22 MR. WATSON: Q. So, Panel, in dealing
23 with plant performance, if we could just start with
24 some general questions on reliability indices.

25 I understand there are a variety of

1 indices which measure the reliability performance of a
2 power plant, but is it fair to focus on four of these
3 main indices: First of all, in no particular order,
4 POFs, P-O-F; second of all --

5 THE CHAIRMAN: Perhaps you could, just
6 for the uninitiated, just tell us what that is.

7 MR. TABOREK: Planned outage factor.

8 MR. WATSON: Planned outage factor.

9 THE CHAIRMAN: I know it has been said
10 before.

11 MR. TABOREK: These are outages in which
12 you have a long time in which to schedule them;
13 typically more than a week, but anywhere in a year,
14 really, for all practical purposes.

15 MR. WATSON: Q. And, Mr. Taborek, I have
16 found the chart or the descriptions on page 36 of the
17 1990 Forecast of Reliability Indices of some assistance
18 to me, as they describe all the various outages; the
19 planned outage.

20 The next one I was to referred to, the
21 MOF, the maintenance outage factor; the third one is
22 DAFOR or DAUFOP, depending on whether you are talking
23 about nuclear plants or fossil plants, assuming the
24 fossils are on reserve at some times; and the forth
25 factor is capability or incapability factor, depending

1 on how you look at it.

2 Is it fair to say that those are the four
3 main factors?

4 MR. TABOREK: A. Yes.

5 Q. And the values, as well as the
6 definitions, are published each year in the forecast of
7 reliability indices?

8 A. Yes.

9 THE CHAIRMAN: What page was that on, did
10 you say?

11 MR. WATSON: In the 1990, Mr. Chairman,
12 it is on page 36. There is a series of definitions.

13 THE CHAIRMAN: All right.

14 MR. TABOREK: The whole of Section 4 of
15 the report from page 33 through to page 36 gives
16 varying levels of definitions of these indices.

17 DR. CONNELL: Of what exhibit?

18 THE CHAIRMAN: It is 1990. What Exhibit
19 No. is 1990? 140, is it?

20 MR. WATSON: It was made an exhibit just
21 at the start of Hydro's direct evidence.

22 MR. TABOREK: It is an Interrogatory
23 2.7.40. I am not aware of it being an exhibit.

24 THE CHAIRMAN: Oh, all right.

25 MR. WATSON: The 1990 forecast? It was

1 just introduced in evidence on Tuesday.

2 MRS. FORMUSA: No. That was the one that
3 Mr. Shepherd objected to. I was filing it with respect
4 to Interrogatory 2.2.22.

5 THE CHAIRMAN: Oh, yes. Did it get a
6 number?

7 MRS. FORMUSA: No, it didn't. You will
8 recall that we filed a list of interrogatories to which
9 we might have to refer.

10 THE CHAIRMAN: Oh, yes. All right.

11 MRS. FORMUSA: It was not given an
12 exhibit number, and the earlier versions of '88 and '89
13 were included behind 2.7.40 in that package.

14 So, all three of those reports from '88
15 to '90 were in response to two interrogatories in the
16 package that our panel filed at the beginning, which
17 was not given an exhibit number.

18 THE CHAIRMAN: I wonder if it should be,
19 perhaps? I know we do not make interrogatories an
20 exhibit. Should this one be an exhibit, do you think?

21 MRS. FORMUSA: This report?

22 MR. WATSON: I was going to refer to the
23 concepts in this, and there may be some reference to
24 some numbers in some of the earlier forecasts, as well
25 as this one. We certainly can make it an exhibit, if

1 you would like.

2 THE CHAIRMAN: It is 2.7.40. Have you
3 got it?

4 DR. CONNELL: Yes. Here it is, here.

5 MR. WATSON: So, Mr. Chairman, why don't
6 we make it an exhibit?

7 THE CHAIRMAN: Obviously, I still haven't
8 got right. If I look at page 36, it doesn't have
9 anything.

10 MR. WATSON: Okay. If you are looking at
11 2.7.40, that will have the '88 and '89.

12 THE CHAIRMAN: Which one are you talking
13 about?

14 MR. WATSON: If you look at part of the
15 package that Hydro filed during their evidence, 2.2.22,
16 you will see the '90 forecast.

17 MR. TABOREK: The earlier versions, the
18 '89 report has the same definitions occurring between
19 pages 32 and 35. It appears every year. It is a
20 standard set of material.

21 THE CHAIRMAN: Okay. Everyone set now?

22 MR. WATSON: So, are we going to make
23 2.7.40 the next exhibit, which would be the '88 and '89
24 indices?

25 THE CHAIRMAN: Well, the one you are

1 referring to now is the '90. Do you intend to refer to
2 the '88 and '89, as well?

3 MR. WATSON: I think all three of them
4 are important, Mr. Chairman.

5 MS. PATTERSON: In response to
6 Interrogatory 2.7.40, I have a report dated January
7 1990, that says 1989 Forecast of Reliability Indices,
8 but I do not see 1988.

9 MR. WATSON: I could be wrong. I thought
10 both of them were supposed to be attached to that
11 interrogatory.

12 Q. Is that your understanding, Mr.
13 Taborek?

14 MR. TABOREK: A. Yes.

15 MRS. FORMUSA: It should have been in
16 that bundle.

17 MS. MORRISON: It is.

18 MS. PATTERSON: It is.

19
20
21
22
23
24
25 ...

1 [3:05 p.m] THE CHAIRMAN: Well, why don't we make
2 the '88, '89 and '90 forecasts one separate exhibit.
3 How is that? We don't need to go through the paperwork
4 right now; we'll just give it a number. Number...?

5 THE REGISTRAR: 148, Mr. Chairman.

6 THE CHAIRMAN: All right.

7 ---EXHIBIT NO. 148: 1988/89/90 Forecasts of
8 Reliability Indices for use in
Corporate Planning Studies.

9 MR. WATSON: Q. Mr. Taborek, as I
10 understand it, DAFORs are used for nuclear units; is
11 that correct?

12 MR. TABOREK: A. Yes.

13 Q. And that measures the probability
14 that a given unit will not be able to produce power
15 during peak load periods?

16 A. Yes.

17 Q. And the DAUFOP, in effect, does the
18 same thing for the fossil units?

19 A. Yes.

20 Q. Is it fair to say that the reserve
21 margin is largely determined by the amount of capacity
22 needed to reliably meet peak load?

23 A. Yes.

24 Q. And would you then agree with me that
25 the DAFOR or the DAUFOP is the most important plant

1 reliability index for determining the required reserve
2 margin?

3 A. Yes.

4 Q. Now in looking at peaking units, I
5 understand their primary importance is to provide
6 capacity?

7 A. Yes.

8 Q. And while they provide some energy,
9 this is of less importance?

10 A. Yes.

11 Q. And for base load units, on the other
12 hand, capacity is important but energy is also very
13 important?

14 A. Yes.

15 Q. Now, in dealing with energy
16 production, the most important measure of unit
17 reliability is the incapability factor?

18 A. Yes.

19 Q. And that measures the fraction of a
20 unit's theoretical possible output which cannot be
21 produced due to equipment and regulatory constraints?

22 A. Yes.

23 Q. Now, if a plant has very cheap
24 operating costs and no transmission line constraints,
25 it will tend to always run at the maximum power of

1 which it is capable; is that fair?

2 A. Yes.

3 Q. And in that case, the plant's
4 capacity factor will equal the capability factor or 100
5 minus the incapability factor?

6 A. Yes. And that's assuming there is
7 adequate demand to require it.

8 Q. Yes.

9 And since a primary function of a base
10 load unit is to provide energy, the incapability
11 factors of base load units determine the number of
12 units which are required; is that fair?

13 A. It will have an effect, yes.

14 Q. It will have a substantial effect,
15 will it not?

16 A. A substantial effect.

17 Q. Is it fair to say that if all other
18 things are equal, if the base load units have a higher
19 incapability factor, they will produce less energy in a
20 year and more units will be required to produce that
21 energy?

22 A. Yes.

23 Q. Just two quick clarification points.

24 My understanding is that the '88 forecast
25 of reliability indices was what was used in the DSP; is

1 that correct?

2 A. Yes. Yes, it was.

3 Q. And further I understand that the '89
4 forecast was used in the '91 reliability review?

5 A. Right.

6 Q. If I could ask you just a few
7 questions on fossil unit DAUFOPs. As with the other
8 figures, DAFORs, MOFs, POFs, the DAUFOPs come from
9 these forecasts of reliability indices that we have
10 been talking about.

11 A. Yes, they do.

12 Q. And those forecasts give us values
13 for each unit or station for each of the next ten years
14 but they also give us a "long-term average value," as
15 well.

16 A. Yes.

17 Q. Now, Mr. Taborek, and the rest of
18 panel, if you would turn to Table 1 of Exhibit 147,

19 DR. CONNELL: Once again, Mr. Watson, I
20 presume these are percentages, but it doesn't so
21 indicate on the table.

22 MR. WATSON: Yes, they are percentages,
23 and Mr. Taborek can confirm that.

24 MR. TABOREK: Yes.

25 MR. WATSON: Thank you, Dr. Connell, we

1 will be sure to include that in future.

2 Q. Mr. Taborek, looking at Table 1, you
3 will see it has values from the '88, '89 and '90
4 forecast. And I should tell you that these are average
5 values for a station. The only one where it really
6 comes into effect is Lakeview. And could we leave the
7 figures so that, subject to your check, we will
8 proceed?

9 MR. TABOREK: A. Fine.

10 Q. Now, from the '88 to the '89
11 forecast, the DAUFOPs are increasing except for Lennox.
12 From '89 to '90, the DAUFOPs are roughly the same, save
13 for Lakeview, where they continue to increase. Can you
14 tell us, generally, why that is so?

15 A. It is essentially due to the amount
16 of funding available. That the 1988 forecast was a
17 forecast of adequate readily available funds.

18 In the '89 forecast, there were some
19 general spending restraints that we were planning under
20 and so there was a reduction of maintenance spending,
21 resulting in a general increase in forced outage rates
22 as a result of the general spending curtailment.

23 And in 1990, there was a particular
24 reduction in -- or there was a limitation of spending
25 on Lakeview, and Lakeview, in particular, increased in

1 that year. The others are essentially the same or very
2 close to the '89 numbers. So, it's spending restraints
3 from one year to the next.

4 Q. When you say spending, are you
5 talking in a global context or are you talking
6 specifically about OM&A?

7 A. For maintenance and for
8 rehabilitation of the stations.

9 Q. We were talking earlier this morning
10 about the Lakeview units, and they were found to be in
11 worse shape than previously expected.

12 Now, I understand the rehab costs for
13 Lakeview and Lambton have gone up and also that the
14 costs schedules and the whole scope of the
15 rehabilitation is under review with decisions expected
16 sometime later this year.

17 A. That's correct.

18 Four of the units are going ahead with
19 essentially a full rehab and four other units are being
20 re-evaluated.

21 Q. Does the 1988 forecast reflect the
22 conditions of these plants as you now understand them
23 to be? And I would ask you the same question about the
24 '89 forecast and the '90 forecast.

25 A. Well, I think each year reflected the

1 knowledge of the year, so that '88 and '89 would not
2 reflect the now condition. There has been an extra
3 year of knowledge accumulated in each case.

4 Q. Is it fair to say that that's one of
5 the reasons why the Lakeview DAUFOP has increased so
6 much because of your now greater understanding of what
7 its condition is.

8 A. Yes, that would have led to an
9 increased level of spending; and in curtailing the
10 spending, that has the effect we have described, so the
11 three are linked.

12 Q. In looking at the rehab plan for
13 these units, is it fair to say that if all the
14 previously planned work is not actually carried out, it
15 would follow that the units after the rehab that is
16 carried out would be in worse shape than previously
17 anticipated or not as good shape as you would have
18 hoped--

19 A. That's correct.

20 Q. --and therefore their performance
21 would be poorer?

22 A. That's correct. The four units that
23 have been fully rehabed will perform better than the
24 four units that have not been.

25 Q. Can you tell me about Lambton? Is

1 that scheduled to be fully rehabed? And the reason I
2 am asking you that is that I notice the DAUFOP doesn't
3 change.

4 A. Yes. There have been some minor
5 curtailments in Lambton's spending, on the spending on
6 Lambton, but marginal compared to the curtailment at
7 Lakeview.

8 Q. Now when you say marginal that is
9 marginal in such a way that it is not going to affect
10 the DAUFOP?

11 A. Yes, yes.

12 Q. If you can turn to Table 2, which are
13 further DAUFOP numbers. And each of these forecasts
14 gives numbers for the next, for the next ten years, and
15 then a long-term average. And please notice that under
16 the average, it is after rehabilitation.

17 A. Yes.

18 Q. So, in effect, what we have done is
19 taken out the values for the next few years while they
20 are under rehabilitation to try and get a more accurate
21 real value for how the units will perform.

22 It appears as though Hydro is projecting
23 virtually the same or a slightly improved performance
24 in their fossil units throughout the remaining lives of
25 these units; is that fair?

1 A. Yes.

2 Q. And we were talking before about the
3 plants aging. Could you reconcile the long-term
4 constant DAUFOP with the aging of these plants or is
5 the answer the money that you just talked about?

6 A. I am not sure what you want me to
7 reconcile. What versus what?

8 Q. As a plant ages--

9 A. Yes.

10 Q. --usually that would affect the
11 DAUFOPS?

12 A. It could. There are circumstances
13 where the DAUFOPS will improve and some where it will
14 deteriorate. But okay, yes.

15 Q. Well, perhaps we can turn to the next
16 page then which is entitled, "Lakeview DAUFOP
17 Stylized."

18 A. I am just a little bit uncomfortable
19 with the stylized. What I would like to do is put up
20 the actual chart for Lakeview if I may. And you are
21 referring I believe to the lower line?

22 Q. I think they both show the same
23 pattern as the stylized curve and in effect what you
24 have is over the last decade the performance has
25 deteriorated and then there is going to be --

1 A. Over the last decade, okay. As I see
2 it from, '71 to '81, '82, '83, there was a general
3 improvement with age and then a sharp deterioration
4 with age. And then with the sharp deterioration
5 arrested by rehab programs, the traditional historical
6 level is restored. That is how I would read that
7 chart.

8 Q. Okay.

9 And the historical levels restored are,
10 in effect, the constant DAUFOPs that you see on both--

11 A. Yes.

12 Q. --that chart that you are displaying
13 on the overhead and also the stylized DAUFOP which is
14 in Exhibit 147.

15 A. Yes.

16 Q. And it's fair to say, regardless of
17 which one you look at, you expect an improvement in the
18 DAUFOP after rehabilitation?

19 A. Yes.

20 Q. Which is evidenced by the fact that
21 the level of DAUFOP is less than it was before the
22 rehabilitation?

23 A. Yes.

24 Q. And also you do not expect any
25 significant deterioration in performance of the plant

1 for the rest of its life.

2 A. And this is where money comes in.

3 That there is an appropriate maintenance program to
4 ensure that. Or that would have to be in place to
5 enable that to happen.

6 Q. So that program is in place. You are
7 putting or it is your intention to put the appropriate
8 money into Lakeview so that the DAUFOPs remain constant
9 over the rest of its life -- or its DAUFOP remains
10 constant?

11 A. Well, there is a difference between a
12 forecast and an intention. The forecast is that that
13 is what the corporation will do and the reliability
14 indices reflect that. The corporation may find itself
15 in varying circumstances that it will or it won't. If
16 we get improved intelligence as to the corporate
17 intentions we will modify the forecasts.

18 And my forecasting like this can't make
19 the company spend.

20 Q. I'm quite aware of that.

21

22

23

24

25

...

1 [3:20 p.m.] As presently advised, this is the Hydro
2 plan?

3 A. Yes.

4 Q. And of course, there is no question
5 that things may change and you may get overruled?

6 A. Yes.

7 Q. Now, I would like to explore that
8 constant DAUFOP, a little bit, if I could. We have
9 talked earlier about a planning life of 40 years, and
10 given that you don't expect any additional major
11 equipment problems, why do you expect the units to
12 become economically obsolete after 40 years of
13 operation?

14 A. I didn't say that we would not have
15 further maintenance problems or equipment problems, is
16 the phrase I think you used. I think that we would
17 work to deal with them as they occurred.

18 Q. And assuming that you do, you are
19 going to maintain your constant DAUFOP?

20 A. Yes.

21 Q. Assuming you do maintain that
22 constant DAUFOP --

23 A. And, if I may, this is a forecast for
24 10 years. There is another 10 years beyond that which
25 we will forecast when we get there and at that time we

1 will make appropriate forecasts for the beyond period.

2 Q. Well, in the forecast you not only
3 forecast the next 10 years, you also have another
4 column for long-term forecast; don't you?

5 A. But if you will notice that there is
6 a change in the character in the last 10 years. In the
7 first 10 years, there is a forecast for every year. In
8 the 10-year and beyond period, it's a single number for
9 all future years.

10 It's a reflection of the best present
11 estimate, but it's indicating less confidence in the
12 fidelity of the forecast in the long term with respect
13 to those parameters.

14 Q. I understand you might not be as
15 confident about those numbers. It's fair to say that
16 the numbers are the same, though, the number for the
17 long-term projection is the same as the last few years
18 in this decade?

19 A. Yes.

20 Q. And again, that takes me back to my
21 concern. If, in fact, your DAUFOPS as predicted seem
22 to be to be the same, not only through this decade by
23 long term, why do you expect the unit to become
24 obsolete after 40 years of operation?

25 A. The word "obsolete" is not quite the

1 correct word.

2 The units will have basically reached the
3 end of their service lives as a result of three factors
4 bearing on the station. One is that to maintain
5 reasonable performance with aging stations will require
6 more money; two is there will be more economic
7 alternatives available; and three, that environmental
8 and other regulations will have evolved to the point
9 where the station may not be environmentally
10 acceptable.

11 Q. If any or all of those things are
12 occurring as you go along your time line, isn't it fair
13 to say that that's going to affect the amount of money
14 that you are going to put into these units?

15 A. As each of these pieces of
16 information becomes known we will evaluate whether it
17 is appropriate to continue spending on the station or
18 whether it is appropriate to replace it. If I may give
19 you an example...

20 Q. Please.

21 A. We have spoken at some length about
22 the NOx/VOCs regulations, and the form of the
23 regulation, if it's a form that would require SCRs,
24 selective catalytic reduction on Lakeview, then the
25 station would become uneconomic, compared to replacing

1 with combustion turbine units.

2 Whereas, if the regulation confines those
3 kinds of devices to stations that have a higher
4 capacity factor and suits the low capacity factor, low
5 energy output stations with a different type of NOx
6 control, then the station may continue to be economic,
7 and that is sort of independent to the wear and other
8 factors that occur.

9 Q. Does that apply if, for instance, the
10 coal units are going to be intermediate loaded?

11 A. Does that apply, could you qualify
12 what you mean by "that"?

13 Q. Your explanation that you just went
14 through. That may apply to a peaking unit.

15 A. If you mean does the potential for
16 high capital costs put peaking stations more at risk
17 than base load stations, the answer is yes, because
18 you, basically, write off those costs on a base load
19 station over many more megawatthours of energy
20 production than over a peak station.

21 And the same, incidentally, holds true of
22 a young station versus an old station. The timing of
23 the regulation is similarly critical, because then you
24 have, in the case of an old station, fewer years in
25 which to write off your single capital investment.

1 Q. So, from that is it fair to say that
2 putting an SCR on a base load unit is cheaper than
3 using combustion turbine, for instance?

4 A. Yes. The economics would favour
5 continuing to maintain the life of the higher capacity
6 factor station.

7 And again, one has to be very careful and
8 look at all the environmental regulations that are
9 being applied and all of the effects at the time. I am
10 very sensitive about environmental regulations because
11 they change frequently, they change in many forms, and
12 words and commas can make quite a difference.

13 Q. So, just to continue on with this.
14 What you are saying is by looking at these three
15 factors, greater money being spent, economic
16 alternatives being available, environmental regulations
17 changing, become more strict, that may very well affect
18 the prediction of a constant DAUFOP to the end of a
19 unit's life?

20 A. Yes.

21 MR. SNELSON: A. I don't think that we
22 are predicting, in an absolute sense, constant DAUFOP
23 to the end of the station's life. We have a
24 simplification to the real world, and you seem to be
25 trying to work backwards from the simplification to

1 impute something about the real world from what is
2 really a simplification.

3 The simplification that we have made is
4 that units continue operating in a normal and
5 satisfactory manner at the long-term DAUFOP that is in
6 the forecast, until its retirement date, and then,
7 suddenly, it is taken out of service.

8 Now, that is a simplification to the real
9 situation, which is that units will continue along,
10 more or less in normal performance and acceptable
11 performance, and, then, there will become indicators of
12 either incipient problems sometime in the future, which
13 may start to show up in current performance. And
14 through a process that is hard to define at this time,
15 there will be decisions made to retire, and the units
16 over a period of time will be taken out of service.
17 During that period of time, then, it is quite possible
18 that performance may deteriorate significantly.

19 So, we have modelled something as though
20 it is good performance and then it is suddenly taken
21 out of service. In reality, it is going to be
22 reasonably good performance and then some deteriorating
23 service and gradually being replaced with some new
24 capacity.

25 So, I don't think that you should assume

1 that what we have forecast is a precise prediction of
2 how they will retire. It's an approximation to the
3 retirement process.

4 Q. We have been dealing with Lakeview.
5 Dealing with Lambton and Nanticoke, it appears as
6 though you are projecting that future performance will
7 be somewhat worse than recent history. Can you tell us
8 why that is?

9 MR. TABOREK: A. Maybe the easiest thing
10 is to... Lambton.

11 THE CHAIRMAN: Which table are you
12 looking at?

13 MR. TABOREK: I will have to introduce
14 these in evidence. They are not now in evidence in
15 these forms.

16 THE CHAIRMAN: Wasn't that picture in
17 before?

18 MR. TABOREK: What I showed you was the
19 fossil system total before, sir. I have now broken the
20 system down into the three plants, three main plants,
21 Lakeview, Lambton and Nanticoke.

22 THE CHAIRMAN: Is that true of the one
23 before as well, was it?

24 MR. TABOREK: Yes, it was, the Lakeview
25 one.

1 THE CHAIRMAN: Perhaps two should be
2 referred to by number.

3 MR. TABOREK: These three figures should
4 go in. We need two numbers.

5 THE REGISTRAR: 149 and 150, sir.

6 THE CHAIRMAN: 149 is the graph that Mr.
7 Taborek referred to in the last five minutes.

8 MR. WATSON: That would be the Lakeview
9 incapability graph. And this is the Lambton
10 incapability figure.

11 ---EXHIBIT NO. 149: Lakeview Incapability Graph.

12 ---EXHIBIT NO. 150: Lambton Incapability Graph.

13 MR. TABOREK: What this shows is the
14 forced rates essentially maintain their historical
15 levels, but there are slight increases in the total
16 incapability, again after rehabing.

17 MR. WATSON: Q. I understand that you
18 are again planning on spending substantial funds on the
19 rehabilitation of Lambton?

20 MR. TABOREK: A. Yes.

21 Q. And could you tell us why you expect
22 this decreased performance when you are spending these
23 funds?

24 A. I think I would refer you to Panel 8
25 in that respect. And Nanticoke, you asked about

1 Nanticoke, as well?

2 Q. Yes.

3 THE CHAIRMAN: Was the answer the same
4 for that?

5 MR. TABOREK: In this instance --

6 THE CHAIRMAN: That would be another
7 number then.

8 MR. TABOREK: This will be the third.

9 THE REGISTRAR: 151.

10 ---EXHIBIT NO. 151: Nanticoke Incapability Graph.

11 MR. TABOREK: And I don't view that as
12 being significantly different from the recent history.

13 MR. WATSON: Q. So, in effect, you would
14 analyze that in the same way that you did Lakeview?

15 MR. TABOREK: A. Yes.

16 Q. And the same factors would come into
17 play?

18 A. Yes.

19 Q. And at the life you do not have a
20 step function?

21 A. That's correct.

22 Q. You have a general winding down of --

23 A. There is a very dynamic set of
24 decisions and processes that are going through in that
25 time.

1 Q. Which evolve over time. And as you
2 make those decisions you may run a plant for more than
3 40 years, especially if you put a lot of money into the
4 plant and you have been able to maintain your DAUFOPs
5 at a constant level.

6 That would be one of the decisions you
7 would make, whether to life-extend, for instance?

8 A. Indeed. But the best number is 40.
9 And we do say that having said 40, that there is a
10 possibility of some units slightly more and some
11 slightly less. And in the direct testimony we went
12 into this at some depth.

13 Q. Yes. And the fallout from this would
14 be, if you did have the constant DAUFOPs to the 40 year
15 period and you decided to life-extend based on these
16 factors that you have told us about, in particular, the
17 three that you have mentioned, then that would have
18 ramifications with respect to the building of new
19 units?

20 A. Yes, it would.

21 But, I think I come back to the fact that
22 at 40 years this is a long life for fossil units, it's
23 longer than they were designed for, and we believe it
24 to be the most appropriate life to use in planning.

25

...

1 [3:37 p.m.] Q. Just before you take that off, Mr.
2 Taborek, you have "forced." Is that forced outage
3 rates?

4 A. Yes.

5 Q. And "total"; that is the combination
6 of force plus --

7 A. That is incapability.

8 Q. The total is incapability?

9 A. I wanted to avoid a lot of the
10 jargon, and so I tried to simplify it in my prep
11 material.

12 Q. Is it fair to say that incapability
13 factors and DAUFOPs do not necessarily mirror each
14 other during the course of a unit's life?

15 A. That is true. If you spend a good
16 deal of time on maintenance, your incapability will be
17 up, but the money well spent presumably will put the
18 forced outage rate down.

19 As a matter of fact, it is not too
20 evident there, but if we go back to the Lambton one, it
21 is especially evident that there is a lot of planned
22 maintenance, there is the forced outage creeping up,
23 and then there, it is restored by the maintenance.
24 That illustrates the effect.

25 Q. That is the incapability factors.

1 How about the forced outage rate and DAUFOP? What is
2 the relationship between those over time?

3 A. Well, that is the same thing as I
4 have said.

5 Q. As the incapability factor?

6 A. No, no, no. You said forced outage
7 rate and DAUFOP?

8 Q. Yes. So, those are the same, as far
9 as you are concerned, for the fossil unit?

10 A. Yes.

11 Q. Okay.

12 MR. WATSON: Now, Mr. Chairman, I just
13 noticed the time now. It is twenty to four. I am in
14 your hands as to whether you want to take a break. I
15 am quite prepared to continue.

16 THE CHAIRMAN: How are you doing?

17 MR. WATSON: I am doing quite well, Mr.
18 Chairman. I am quite confident that I will be finished
19 today.

20 THE CHAIRMAN: Well, you have to stop
21 around four-thirty, so will we take a 10-minute break?
22 Will that do it?

23 MR. WATSON: Yes.

24 THE CHAIRMAN: All right.

25 THE REGISTRAR: The hearing will recess

1 for 10 minutes.

2 ---Recess at 3:40 p.m.

3 ---On resuming at 3:53 p.m.

4 THE REGISTRAR: Please come to order.

5 The hearing is again in session. Please be seated.

6 THE CHAIRMAN: Mr. Watson?

7 MR. WATSON: Mr. Chairman, during the
8 break, Mrs. Formusa had copies of Exhibits 149, 150 and
9 151 made, and I trust that you have those in front of
10 you now.

11 THE CHAIRMAN: Yes.

12 MR. WATSON: Q. I just have a quick
13 question with respect to Exhibit 150, Mr. Taborek.

14 MR. TABOREK: A. Yes.

15 Q. That is the Lambton incapability
16 graph.

17 Just doing a rough estimate of that,
18 looking at the forced figures at the bottom, it looks
19 as though, if you average out the values after rehab
20 and compare those to the average before rehab, the
21 incapability seems a little bit higher; is that fair?

22 A. It depends what period. I think it
23 might not be in the '80s, but I think it would be in
24 the '70s, and I think probably overall, just eyeballing
25 it, it would appear to be that way.

1 Q. Well, again, I do not want to put it
2 any higher than that. I just eyeballed these figures
3 and it seemed as though after you have done the rehab,
4 it looks as though there is a little more incapability
5 than before you did the rehab and I am just wondering
6 if that is so, why that is so.

7 A. I can't answer that. I would refer
8 you to Panel 8.

9 Q. Okay. I was going to ask you the
10 same thing about the other ones, but I will deal with
11 all of that in Panel 8.

12 A. Yes.

13 Q. If you could turn to Table 3, please,
14 which shows fossil station OM&A costs in millions of
15 1990 dollars for three existing plants and one future
16 plant.

17 As you can see, the data was obtained
18 from interrogatories and a thermal cost review, and in
19 fairness, we converted the 1986 and 1989 values to 1990
20 dollars, and the rate we used was 5 per cent for the
21 conversion from '89 to '90, and 20 per cent for '86 to
22 '90; in other words, 5 per cent a year.

23 Using those values, it appears as though
24 there are large increases in OM&A for the three major
25 existing coal stations. Can you tell us why that is

1 occurring?

2 A. Again, I think I would refer you to
3 Panel 8.

4 Q. Table 3 also shows the OM&A costs for
5 the existing stations appear to be higher than for the
6 new stations. Would you prefer that we deal with that
7 in Panel 8, as well?

8 A. Please.

9 Q. All right. And if I could take this
10 opportunity to clarify one thing you said in your
11 direct evidence.

12 I believe you mentioned that you were
13 responding beyond rehabilitation, an extra \$30-million
14 a year and \$20-million on Nanticoke.

15 A. Allow me to check. I thought it was
16 50 and 30, but I will just check. No. You are
17 correct. It is 30 and 20.

18 Q. And is the 20 included in the 30 or
19 is it separate?

20 A. Yes, it is included in the 30.

21 Q. So, of the \$30-million per year that
22 you are spending, 20 goes for Nanticoke and 10 goes for
23 all the others?

24 A. Yes.

25 Q. And that is extra money beyond the

1 rehabilitation?

2 A. Yes.

3 Q. If you could turn to Table 4, which
4 is a forecast of long-term DAUFOPs, the data is from
5 the 1990 forecast and shows the forecast DAUFOPs for
6 the existing stations is worse than the new stations.
7 Can you tell us why that is so?

8 A. Again, I would refer you to Panel 8.

9 Q. Table 5, Panel, is a DAFOR forecast
10 for the nuclear units and it is from the 1990 forecast
11 and is averaged over the periods shown and it shows the
12 units DAFORS improving through the '90s.

13 Maybe I am anticipating you, Mr. Taborek.
14 I was going to ask you some questions on this. Do you
15 want to deal with this or is this a Panel 9 issue?

16 A. Well, I will deal with it to the
17 extent I can and I would propose to deal with it using
18 similar material for the nuclear stations as I showed
19 you for the fossil stations.

20 Q. Okay. Basically, I wanted to deal
21 with the same analysis, if I could. The nuclear plants
22 are, in effect, showing a constant DAFOR over their
23 life -- sorry. They are showing an improving DAFOR
24 over their lives through the '90s, except for Bruce
25 "B", and --

1 A. Well, I think what I would like to do
2 is put -- again, each of these will be an exhibit or is
3 an exhibit. Each of these is new material.

4 THE CHAIRMAN: I think we should consign
5 a number now, so if there's problems with reading the
6 transcript, we will know what we are talking about.

7 THE REGISTRAR: Number 152.

8 THE CHAIRMAN: Number 152. Which is
9 the...

10 MR. TABOREK: The Pickering incapability
11 forced and total, Pickering "A" incapability, forced
12 and total.

13 Now, what did -- you described --
14 ---EXHIBIT NO. 152: Pickering "A" incapability, forced
15 and total.

16 MR. WATSON: Q. Looking at Table 5, it
17 appears as though the forecast DAFORS are decreasing
18 over time.

19 MR. TABOREK: A. Well, I guess I would
20 ask, compared to what period?

21 Certainly, the period from '83 to '89 in
22 which units are forced out on their tubing, there was.
23 But compared to the period '76 to '81, they are not.
24 That period is better. And then, if you consider the
25 whole, so I do not necessarily agree with the statement

1 you have made, if you look at all the years like that.

2 Q. I was simply looking at the forecasts
3 that you put forward in your 1990 figures, which seem
4 to indicate through the '90s, anyway, that the DAFORs
5 are improving, if you will. They are getting smaller?

6 A. Well, I think that is a small change,
7 but, yes, there is a small improvement. I view that as
8 essentially returning to historical good levels.

9 Q. For instance, Bruce "A" is changing
10 from 21.3 to 16.

11 A. Oh. Bruce "A".

12 Q. And Pickering "A" is changing from
13 18.3 to 15.3?

14 A. Yes, yes.

15 Q. Okay.

16 A. And here is the picture for Bruce
17 "A", and I think it is quite similar to Pickering's,
18 really. There is --

19 THE CHAIRMAN: Number?

20 THE REGISTRAR: 153.

21 ---EXHIBIT NO. 153: Bruce "A" Incapability, Actual
22 and 1990 Forecast.

23 MR. TABOREK: 153, Bruce "A". Then
24 again, there is a similar picture of improving
25 performance through the '70s and into the mid-'80s, and

1 then a deterioration and then a rehabilitation program
2 being defined. And then, an improvement as a result of
3 that and yes, a gradual improvement after that.

4 MR. WATSON: Q. Okay. And if we were to
5 go through the same analysis that we went through with
6 the fossil plants and looking at these factors for the
7 life of the plant, again, you are not going to have a
8 step function at the end of the 40-year planning life.

9 You are again going to look at the same
10 sort of factors to determine what should be done with
11 these units when they reach their 40-year planning
12 life?

13 A. Yes.

14 Q. Is that fair?

15 A. Yes.

16 MR. SNELSON: A. The overall reason for
17 the improving trend through the '90s is something we
18 can tell you about. For the details, you would have to
19 go to Panel 9.

20 But the overall reason is that through
21 the 1980s, the late 1980s in particular, we have had
22 significant deterioration in performance of our nuclear
23 plant that has led to a backlog of work in things that
24 require fixing, and it is not something which can be
25 turned around in one year.

1 One of the things that is necessary to
2 turn it around is more trained people and we have a
3 program to hire a lot more people to operate and to
4 maintain our nuclear stations, and the generally
5 improving trend is the forecast that as those people
6 are trained and become effective and they work on the
7 backlog of things that need to be repaired and so on,
8 that that will lead to an improving trend. But the
9 details of that, you should address in Panel 9.

10

25

...

1 [4:04 p.m.] Q. Thank you.

2 So, in dealing with DAUFOPs or DAFORs, is
3 it fair to say that any increase in those for the
4 existing fossil or nuclear units would increase the
5 required reserve margin?

6 MR. TABOREK: A. Yes.

7 Q. And, of course, increasing that
8 reserve margin is primarily going to increase the need
9 for, or accelerate the installation of, combustion
10 turbines?

11 A. Yes.

12 MR. SNELSON: A. Or other generating
13 capacity.

14 MR. WATSON: Thank you.

15 If I could have a minute please, Mr.
16 Chairman?

17 ---Off the record discussion.

18 MR. WATSON: Mr. Chairman, I was going to
19 have a series of questions on various incapability
20 factors of specific units which are referenced in
21 Tables 6 and 7. Based on what the panel has said to
22 date, I am going to defer those questions until Panel
23 8, unless they would like to deal with them today?

24 I take that as a "No," Mr. Taborek?

25 MR. TABOREK: A. Yes, that is a "No."

1 Q. The last table in this package is
2 Table 8 dealing with nuclear unit incapability factors.
3 Again, the data is from the '88, '89 and '90 forecast.
4 And the historical data is taken from Hydro information
5 supplied to NAERC. And I note that in the '88 and '89
6 forecasts, they both assumed 20 per cent average
7 incapability factors throughout their remaining lives,
8 and the 1990 forecast is somewhat different in that it
9 shows an average of about 21.5, with factors varying
10 between 20 and 23 per cent.

11 A. I can give you a summary and again
12 introduce new material. This is the nuclear --

13 THE CHAIRMAN: Just wait until he asks
14 you a question. That would be a good idea.

15 MR. TABOREK: Sorry.

16 MR. WATSON: Q. I was going to compare
17 the various columns in Table 8. Column 4 shows the
18 historic incapability factors and there appears to be a
19 lot of scatter in these numbers. I assume that
20 reflects the impact of the pressure tube problems?

21 MR. TABOREK: A. '85 to '89...

22 MR. SNELSON: A. It is partly pressure
23 tube problems and it is partly some of the other
24 smaller phenomena I was referring to. Pickering "A" is
25 mostly pressure tube problems; Bruce "A" is not.

1 Q. What would it be?

2 MR. TABOREK: A. General wear.

3 Q. General wear.

4 And in future years, is it reasonable to
5 expect that the impact of pressure tubes in these
6 stations will continue to be substantial?

7 A. There will be defined retubing
8 programs, so that all the reactors will be retubed in a
9 cyclic fashion.

10 MR. SNELSON: A. And the retubing of
11 existing reactors will be done in a way that is
12 consistent with the way in which our current new
13 reactors are being built and will incorporate all the
14 measures that we now know of to either prevent or
15 drastically slow the rate of deterioration of pressure
16 tubes, so we expect that new pressure tubes will
17 perform better than the existing pressure tubes in
18 Pickering "A" and Bruce "A."

19 Q. So, there will be an impact due to
20 pressure tubes, but it should be less than the impact
21 you have experienced in the past?

22 A. The main impact over the next few
23 years due to pressure tubes is planned outages to
24 replace pressure tubes that are known to be
25 deteriorating, and the phenomena and the details around

1 that program will be discussed in Panel 9.

2 Following retubing of any particular
3 unit, then the performance is expected to improve and
4 pressure tubes will be a very small part of
5 incapability.

6 Q. Is it fair to say that the effect of
7 pressure tubes has been to increase the incapability
8 factor by approximately 10 per cent?

9 A. I haven't worked it out across the
10 whole system. The impact has been quite high though,
11 and particularly on Pickering "A" and to a lesser
12 extent Bruce "A".

13 I mean, the order of magnitude is that in
14 some years at Pickering "A," we had two units out of
15 service for the whole year. So clearly on that
16 particular station, the effect on incapability was 50
17 per cent.

18 Q. Do you have any figures for the
19 future? Do you know whether the future or what the
20 percent would be on the future impact of the pressure
21 tube problem?

22 A. The Reliability Indices Report which
23 we gave an exhibit number to, the 1991 version--

24 MRS. FORMUSA: 148.

25 MR. SNELSON: I am told it is 148.

1 --is our latest prediction of nuclear
2 incapability and it includes the effects, the expected
3 effects of pressure tube outages, both the planned
4 outages for retubing and any unplanned effects that
5 might occur either before or after retubing.

6 MR. WATSON: Q. Those effects are lumped
7 together, though, are they not?

8 MR. SNELSON: A. Sorry, did you say they
9 are lumped together or they are not lumped together?

10 Q. They are.

11 Is there a separate column for pressure
12 tube effects?

13 A. The people who will testify to
14 nuclear availability on Panel 9 should be able to give
15 some indication of what proportion of that incapability
16 is due to pressure tubes.

17 Q. I will pursue that with them then.

18 Is it fair to say then that looking at
19 the 20 per cent incapability factor which you are
20 basically predicting, that assumes, (1), the future
21 impact of pressure tubes will be roughly as now
22 predicted; and (2), the performance of the entire rest
23 of the plant will be essentially comparable to your
24 recent historical performance?

25 MR. TABOREK: A. Yes, with one proviso.

1 The retubing schedule has no more than one unit out
2 through the 90s where this forecast is done. But in
3 some periods, in the post-2000, I believe, there could
4 be two units out at a time. So, that would be the
5 additional effect. And yes, the work we are doing is
6 intended to restore the historic levels of performance.

7 Q. In addition to the pressure tube
8 problems, have there been any other major problems that
9 have caused large outages and affected a substantial
10 number of units?

11 A. Again while I can give you some
12 information, I think the best source for it is Panel 9.

13 Q. Is it fair to say that the projection
14 of an approximately 20 per cent incapability factor
15 assumes there will continue to be miscellaneous
16 problems affecting the rest of the other portions of
17 the plant, aside from pressure tubes?

18 A. Oh, yes.

19 Q. However, is it also fair to say that
20 20 per cent incapability factor assumes there will not
21 be any major generic equipment problems affecting these
22 plants?

23 A. Yes.

24 Q. Is it fair to say that if you had
25 another new problem with an impact only half as large

1 as a pressure tube problem, that future capability
2 factors could be lowered from the 80 per cent level?

3 A. Well, again in the scale of the
4 problems that we have dealt with up to this point in
5 time aside from the retubing. And so if it were over
6 and above that, yes, by definition.

7 Q. We were talking earlier about outages
8 due to problems dealing with vacuum buildings. If
9 there was a problem with a vacuum building, is it fair
10 to say that could have a substantial effect on a
11 capability factor?

12 A. Yes.

13 Q. Are problems such as vacuum tube
14 problems encompassed in the present forecast?

15 A. Vacuum buildings?

16 Q. Yes, problems with the vacuum
17 building?

18 A. There is provision, there is not a
19 major outage due to a vacuum tube building failure.

20 MR. SNELSON: A. A vacuum...

21 MR. TABOREK: A. I picked up his "tube."
22 Vacuum building being used, sorry.

23 MR. SNELSON: A. There are in the
24 forecast outages, regular outages for vacuum building
25 inspection, and all the systems that are associated

1 with vacuum building; and that is a regular occurrence
2 at each station on about five yearly or thereabout
3 cycle, and again Panel 9 can give you the details, but
4 you may even be able to figure them out from the
5 Reliability Indices Report.

6 Q. Have you had any outages like that in
7 the past, vacuum building outages?

8 A. We have had vacuum building
9 inspections, yes.

10 Q. But that would be something that you
11 would have control over?

12 A. Yes.

13 Q. You haven't had an outage as a result
14 of, a forced outage as a result of problems such as
15 that?

16 A. Not to my knowledge.

17 Q. The 1989 consistent energy set talks
18 about longer planned outages and adjustments to the
19 reliability indices for many units. It appears to be
20 partly related to the pressure tubes as well as SLAR,
21 the Spacer Location and Relocation program.

22 The 1989 forecast, though, is essentially
23 the same as the 1988 forecast at 80 per cent capability
24 factors. Why is that in light of these comments in the
25 consistent energy set?

1 MR. TABOREK: A. What was the date of
2 the consistent energy set?

3 Q. 1989.

4 A. 1989. I'm sorry, I can't comment on
5 the CES assumptions.

6 MR. SNELSON: A. Are you trying to
7 compare the CES with a long-term availability forecast?

8 Q. Yes.

9 A. Because the CES is short term and
10 these other forecasts we have been talking about are
11 long term.

12 Q. Yes. But the CES is in effect
13 talking about something that is going to occur in the
14 future, it's talking about longer planned outages, and
15 I was just curious as to whether -- the '89 figures
16 appeared not to have been adjusted, and I was just
17 curious as to why they were not.

18 MR. BARRIE: A. The consistent energy
19 set only addresses the current year and the next five.
20 It doesn't make any reference to anything longer than
21 five years.

22 Q. I guess the question would then
23 remain: Why wouldn't those five years be addressed in
24 the '89 forecast?

25 A. I thought you were addressing longer

1 term forecasts up to this point.

2 Q. Well, five years is part of the long
3 term --

4 MR. TABOREK: A. The answer in general
5 is there is going to be a sequence that is gone through
6 and that this information in the reliability indices,
7 as I've mentioned, is prepared in the fall and issued
8 early in the year.

9 And then the CES is performed at various
10 points in the year, and they will update with whatever
11 new information is available. Well, as the CESs are
12 produced, as the next fall comes around, now the
13 reliability indices are updated with new information,
14 and I can only assume that there were changes in
15 information in each of those steps.

16 Q. Before I leave this area, I would
17 like to refer you to the Ontario Energy Board excerpts
18 which are the last three pages of Exhibit 147. As you
19 are aware, Panel, the OEB meets each year to look at a
20 number of issues dealing with Hydro, and one of the
21 issues being dealt with last year was the long-term
22 performance capability factors of the nuclear units.

23 And you can see on page 98 of the report
24 of the Board, under paragraphs 5.5.35, where Hydro
25 noted in its argument - and again I note this is a

1 report of the Board, the Board summarizing Hydro's
2 argument, if you will - it indicated that Hydro had
3 substantial agreement with the MEA's submissions
4 respecting capability factors and stated that as part
5 of Hydro's annual review, it should take some of these
6 factors into account. It also commented that the MEA's
7 analysis of nuclear performance was a useful
8 contribution to the subject.

9 Turning the page, you can see the
10 recommendation of the Board, which is Recommendation
11 14, that Ontario Hydro reduce the lifetime capability
12 factors for Pickering "A" and Bruce "A" to 75 per cent
13 from 80 per cent.

14 And I guess my question would be if in
15 fact lower capability factors are implemented for the
16 nuclear units and for the coal units, this is going to
17 increase the need for new base load plants; is that
18 correct?

19 A. Yes.

20
21
22
23
24
25 ...

1 [4:20 p.m.] Q. And this increased need is going to
2 take place regardless of whether the reserve margin is
3 24 per cent or 20 per cent, or anything else; isn't
4 that fair?

5 A. Allow me to consult, please.

6 MR. SNELSON: A. In general terms, you
7 are right. There are some complications but in general
8 terms.

9 Q. Thank you.

10 A. That was based on the premise that
11 performance was being reduced.

12 Q. Yes.

13 A. Performance forecasts are being
14 reduced.

15 Q. That the recommendation by the OEB
16 was implemented, yes.

17 A. Yes.

18 MR. WATSON: That takes care of that
19 area, Mr. Chairman.

20 I had some questions on coal supplies for
21 existing plants. I understand from Mrs. Formusa that a
22 fuels expert is being added to Panel 8, the fossil
23 options panel, and as a result I will defer the
24 questions to that...

25 MRS. FORMUSA: He is already on the

1 panel.

2 MR. WATSON: That person is already on
3 the panel, so that appears to be a more appropriate
4 place to deal with it.

5 Also, I had some questions on the
6 hydraulic system, I will defer those to Panel 6.

7 I have a few quick questions on
8 transmission. And if I could introduce...

9 Mr. Lucas, if you have this exhibit, if
10 we could put that before the Board.

11 THE CHAIRMAN: Number?

12 THE REGISTRAR: It will be 154, Mr.
13 Chairman.

14 MR. WATSON: Q. I have a couple of
15 questions I could deal with before we get to that
16 exhibit.

17 Mr. Taborek, if I could take you back
18 very briefly to the F&D model. Does Hydro use the F&D
19 model to evaluate the reliability of the east and the
20 west system separately?

21 MR. TABOREK: A. No.

22 Q. So the whole system is done as a
23 complete whole?

24 A. Total.

25 Q. The model is capable of doing those

1 separate runs, though?

2 A. Yes, you could model separate
3 systems.

4 MR. SNELSON: A. We have in the past
5 modelled the east system separately. We did not find
6 it satisfactory as a model for the west system
7 separately. And that's 10 years ago studies, but there
8 is no reason to believe that it would be any different
9 today.

10 Q. I understand that in the transmission
11 product you have tables that present unreliability
12 statistics by region. How does Hydro address any
13 regional unreliability problems in planning for new
14 generation?

15 A. Hydro, one of the factors in planning
16 the transmission system is regional reliability in a
17 general sense, though it's not accounted for generally
18 in a probabilistic sense. And regional reliability and
19 adequacy will affect the siting of generation.

20 MR. WATSON: Mr. Chairman, I have a table
21 titled "Transmission Reliability Table," if I could
22 have that made the next exhibit, please.

23 THE CHAIRMAN: Exhibit 154.

24 ---EXHIBIT NO. 154: Transmission Reliability Table.

25 MR. WATSON: Q. Mr. Barrie, these

1 questions may perhaps be addressed to you.

2 In talking about transmission standards,
3 I understand that one of the standards --

4 THE CHAIRMAN: It doesn't say on this
5 table where this comes from. Oh, I see, yes, it does.
6 I am sorry, it does say where it comes from. Go ahead.

7 MR. WATSON: Q. I believe one of Hydro's
8 standards is to have no more than 15 per cent of its
9 delivery points experience interruptions of greater
10 than 50 effective minutes; is that correct?

11 MR. BARRIE: A. Yes, that's right.

12 Q. Now, this table shows under Column A
13 a series of years and under Column B a series of
14 numbers that attempt to show the per cent of delivery
15 points that had interruptions greater than 50 minutes.
16 Those figures were derived from an interrogatory from
17 last year's rate hearing, Exhibit 6.6.62. Subject to
18 your checking those figures, it appears as though only
19 1986 meets the standard.

20 Does that accord with your information?

21 A. Yes, that's correct.

22 Q. And in Column C we have figures for
23 transmission maintenance which were obtained from
24 Interrogatory 2.7.20, showing the amount of
25 transmission maintenance spending over the last five

1 years. And in Column D we have the primary demand, 20
2 minute winter peak, again taken from Exhibit 7, page
3 57, which shows the demand increasing over the 5-year
4 period.

5 The final column is the transmission
6 maintenance in 1990 dollars, which is obtained by
7 taking Column C, the amount spent on transmission
8 maintenance, and dividing it by the peak in megawatts,
9 and that gives a value which appears to be fluctuating
10 somewhat, but overall is not increasing with the
11 demand. And I was curious in looking at all those
12 figures as to why Hydro has not been meeting the
13 standard, and why more money has not been put into
14 transmission maintenance?

15 A. Yes. Hydro has acknowledged at the
16 OEB and at other places that we do wish to spend more
17 money on transmission maintenance to improve the
18 transmission performance.

19 As you say, we have since 1986 not been
20 able to meet this particular standard and it is largely
21 because of monetary constraints.

22 I should say that two major programs have
23 been identified, though, to rectify the situation, and
24 substantially increased expenditure on transmission
25 maintenance is to be expected in the future. Probably

1 not a significant increase until about 1993, but from
2 that point on significantly more money will be spent on
3 transmission maintenance than has been the case.

4 Q. I propose to go, very briefly, back
5 to a conversation that Mr. Snelson and I were having a
6 day or two ago when we were talking about figure 5.1 of
7 the reliability review, and if in fact the reserve
8 margin was decreased from 24 to 21.6 per cent, it
9 looked as though we could save about \$29-million, and
10 if, in fact, that \$29-million was compared to what is
11 currently being spent on transmission, that would be an
12 increase of approximately 50 per cent, which I assume
13 would go a long way toward improving that reliability
14 situation; is that fair?

15 A. Is that a question?

16 Q. Yes.

17 A. \$29-million additional expenditure
18 per year would certainly go a long way towards
19 improving these figures. In fact, the amounts I am
20 talking about in these two programs I have referenced
21 though is considerably more than \$29-million.

22 Q. How much is it, Mr. Barrie?

23 A. It will be of the order of
24 \$100-million. The two programs are to refurbish both
25 the transmission lines and do essential work at the

1 transmission stations and circuit breakers and
2 transformers, and that kind of thing.

3 Q. Over what period of time is that
4 \$100-million to be spent?

5 A. The major expenditure, as I said,
6 won't commence until about 1993. I have seen
7 projections go for 10 years, but the work is likely to
8 go on beyond that. This could be regarded as an
9 ongoing program rather than a time limited program.

10 Q. But while the time is unlimited, the
11 amount isn't, it's still \$100-million.

12 A. Yes, there will be in excess of
13 \$100-million, over and above the expenditure that you
14 see here.

15 MR. WATSON: Mr. Chairman, I know it's
16 4:30, but I have a few questions; I think I can finish
17 quite quickly.

18 THE CHAIRMAN: Go ahead.

19 MR. WATSON: Q. If I could turn now,
20 Panel, to NUGs with respect to transmission lines. I
21 understand that Hydro currently has approximately 1200
22 megawatts of load displacement NUGs and 82 megawatts of
23 purchase NUGs, and according to one of your
24 interrogatories, all of the current NUGs are
25 non-dispatchable; is that correct?

1 MR. BARRIE: A. Yes, that's correct.

2 Q. If a resource is non-dispatchable,
3 doesn't this lead to less flexibility on the system?

4 A. Yes, that's correct.

5 Q. Now, I understand that transmission
6 credit has been assumed as part of the payment to
7 current NUGs. First of all, that's correct; is it not?

8 MR. SNELSON: A. Transmission credits
9 are included as we feel appropriate to those NUGs which
10 are in locations where we expect them to, in the long
11 run, save transmission costs.

12 Q. And the level of the transmission
13 credit is determined by Exhibit 84, the avoided cost
14 determination for the 1989 Demand/Supply Plan?

15 A. Yes.

16 Q. So, you do an individual assessment
17 as to whether specific NUGs should get the transmission
18 credit?

19 A. That's something we were proposing to
20 consider in Panel 3, as part of our avoided cost
21 methodology.

22 We try to tailor-make the transmission
23 credit to suit the particular situation, but there is a
24 fair degree of complexity in that and that's perhaps
25 better left to Panel 3.

1 Q. I was going to ask you whether Hydro
2 had any recent problems where a NUG had caused
3 transmission stability problems.

4 MR. BARRIE: A. Not that I am aware of.

5 Q. Are you aware of the problem with
6 E.B. Eddy facility?

7 A. No.

8 Q. Perhaps I will deal with that at the
9 later panel.

10 Q. And one final question dealing with
11 interconnection assistance. We spoke about it in some
12 length before. It's fair to say that Hydro feels that
13 interconnections have a substantial benefit to the
14 system and that's why they are in place.

15 Has there been any sort of transactional
16 analysis as to the benefit of interconnections?

17 MR. SNELSON: A. Not in a comprehensive
18 way. I can quote you a number as to the degree to
19 which profits from export sales in the early 1980s
20 reduced electricity rates, and for a number of years
21 the reduction was around 6 per cent because of net
22 profits from export sales. But that fluctuates.

23 MR. WATSON: Those are my questions, Mr.
24 Chairman.

25 THE CHAIRMAN: Thank you.

1 Mr. Rodger, you will be tomorrow morning.

2 MR. RODGERS: Thank you, Mr. Chairman.

3 THE CHAIRMAN: Your estimate still

4 stands?

5 MR. RODGERS: Yes, it does.

6 THE CHAIRMAN: Fine. We will adjourn

7 until tomorrow morning at ten o'clock.

8 THE REGISTRAR: This hearing is adjourned

9 until tomorrow morning at ten o'clock.

10 ---Whereupon the hearing was adjourned at 4:35 p.m. to
11 be resumed on Tuesday, May 28, 1991, at 10:00 a.m.
